Now I am interested in finding out what peripheral equipment Kenwood manufactured for use with the 520 series of transceiver and their model numbers. I'll need to know this when I go searching on ebay again...

Thanks again!

Jody

hi,

while not a Kenwood accessory, the Spectronics
digital display is a nice too.

Henry had the same units, the one I have
uses nixie tubes.

take a look in the photo section.

not a must have but an Astatic mic,
looks great and you can use the back of the mic
as a mirror to check if you have the sg switch off
at the rear of the rigs !

To the Group;

I have had a ts-530s and a ts820s,and a ts-930s. Both the 530 and 820 were good rigs and served me well. Should have never gotten rid of my TS-530S. The TS-930s was bought new and from about 6 months down the road it became a problem plagued radio and I would put it into the 'DOG Class'. Best day in my life was when someone bought it, after much of my dollars were poured into it for repairs.
I have been looking for a good review(please don't send me to ARRL or E-Ham, been there done that)on the TS-830S, this is the rig that is the predecessor to the 930.
Do any of you know where I can go and read a write-up about this rig.
I have the manual, etc. But Iam looking for someone that set in front of this rig and actually has operated it for a while on the bands(Ham).
Give me an honest opinion based on their experiences.
I know where there are two of them(very nice condx)and looking at buying one for my shack(like I really need another HF rig).

Please forgive me for the long post.

Hello, I just picked up a Kenwood 830s this last weekend. The mc-50 was bad will not drive the radio. I have a D104 that works, but I understand I may have impedance matching problem. Looking on Heil web site I see they have a kit for the D104.Or is it just better to get a new mic?

I do like my D104 it looks cool.

Chris,

The 830 mic amp will work with either a low or high impedance load presented to it. Have you tried the D104 on the 830? It should sound pretty good as is unless you have a problem with the D104.

9695. 830 Diode Swap

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-01 00:49:40 UTC
From: Gordon
Topic: 9695 Message: 9695

Yesterday I had time to swap out the Product detector Diodes on my TS-830 with some Schottky Diodes. I had already performed the Audio Mod by replacing C-106. After I replaced the diodes, I adjusted L-19 and L-20 on my scope.
So, Then I decided to tune across 20 meters. I came across a bit of a pile-up, so I took a listen to see what or who was there. It was 3XM6JR and he was weak, but copyable, so I gave him a call. I tried 3 or 4 times , then decided that the 100 watts from the 830 was NOT going to break through the East Coast wall to work him. So, I fired up the TS-2000 and the Amplifier. I switched the antenna (7 element yagi) over to the 2000 and to my surprise, he was low in the noise and not workable. I then switched back to the 830 and there he was again, weak but workable. So It tells me that this little 830 hears much better then my TS-2000 . I never did get to work the 3XM6JR station, but with the 830 Barefoot I worked I5zss in Italy, then CT1EHI in Portugal, then, UN7DA in Kazakhstan on 20 metrs. I then switched over to 40 meters and my Vertical and worked LU/R1ANF in the south Shetland Islands, then HA5JI in Hungary and finally CO8ZXZ in Cuba. I received Great reports and when I asked I received "Great sounding Audio " reports also. Neither one of my Antennas is over 38 feet off the ground. The beam at 38 feet and the Vertical at 20 feet. I'm pretty happy the way this little 830 turned out. Now, It's time to sell it and purchase another 830 to repair and make new again.

Hi Gordon, Thanks for your reply. The VTVM I am using has a 1.5 volt range so I would think I would see some indication on the meter but nothing. Maybe like you say the VTVM does not go low enough. I am not sure but we changed out the diodes in the product detector and balanced modulator also and was wondering if that had anything to do with not getting an indication. We also put a .001 capacitor in the C106 position and added the 100 resistor. Any other ideas?

Hi Art,

You can use also the ALC meter in your 830S to check your carrier balance. With mic gain set to zero, any deflection will indicate carrier output in SSB mode. Do you have another receiver you can use? You can listen to your signal on another receiver and minimize carrier that way.

Topic: 9703 Message: 9703

Hi Gordon,

I am glad you saw the same improvement I did. I have been amazed since I did the Shottkey mod on my 830S....The noise floor is definitely better and the 830S' white noise level doesn't give me a headache while listening with headphones now. I think after you make the diode swap, the lack of phase noise in the 830S' receiver lets you hear more signals.....The Shottkey diodes are a cheap fix.

73' Rick KC0HH
Lamar, Colorado

Gordon <n6wk@...> wrote: Today, I opened up my TS-830S and decided to do the Schottky Diode Mod
on the Product detector. I had already opened up the Audio by
replacing C-106 with a .0015 cap . I also had replaced the Band switch
Coupler with the ones from K4EAA.
I installed the new diodes,(Thanks Rick) and the 100 ohm resistor.
I then adjusted the voltage across the resistor with L-19 and L-20 to
600 Mv.
I then tuned up on 20 meters. I worked a station in Portugal and
Italy. They were strong and I received great reports. I then tuned
across 3XM6JR. He was weak but workable. I tried calling a few times
with the 830 barefoot, but was not able to break through the East
Coast wall. So, I figured I would fire up the TS-2000 and my Amplifier
to work him. To my surprise, I could NOT even copy him with the
TS-2000. I switched back to the 830 and there he was. Still weak, but
I could copy him, then back to the TS-2000 and he was too low in the
Noise. Same Antenna feeding both Rigs. (My 7 element Beam)
My Conclusion is, This Mod on the 830 is a great thing. It seems to
lower the noise floor yet the response is Excellent.
I might now have to replace some diodes in the TS-2000.
I am impressed. I am now ready to sell this TS-830S (Gold Label) and
look for another one to repair. After all, Repairing these rigs is my
Hobby !

Subject: [TS-520_820_530_830] Best mic for 830s?

Hello, I just picked up a Kenwood 830s this last weekend. The mc-50
was bad will not drive the radio. I have a D104 that works, but I
understand I may have impedance matching problem. Looking on Heil web
site I see they have a kit for the D104.Or is it just better to get a
new mic?

I do like my D104 it looks cool.

You probably ought to sell the 2000 and hook up the amp to the 830. Hi. What an amazing rig!

Subject: [TS-520_820_530_830] 830 Diode Swap

Yesterday I had time to swap out the Product detector Diodes on my TS-830 with some Schottky Diodes. I had already performed the Audio Mod by replacing C-106. After I replaced the diodes, I adjusted L-19 and L-20 on my scope.
So, Then I decided to tune across 20 meters. I came across a bit of a pile-up, so I took a listen to see what or who was there. It was 3XM6JR and he was weak, but copyable, so I gave him a call. I tried 3 or 4 times , then decided that the 100 watts from the 830 was NOT going to break through the East Coast wall to work him. So, I fired up the TS-2000 and the Amplifier. I switched the antenna (7 element yagi) over to the 2000 and to my surprise, he was low in the noise and not workable. I then switched back to the 830 and there he was again, weak but workable. So It tells me that this little 830 hears much better then my TS-2000 . I never did get to work the 3XM6JR station, but with the 830 Barefoot I worked I5zss in Italy, then CT1EHI in Portugal, then, UN7DA in Kazakhstan on 20 metrs. I then switched over to 40 meters and my Vertical and worked LU/R1ANF in the south Shetland Islands, then HA5JI in Hungary and finally CO8ZXZ in Cuba. I received Great reports and when I asked I received "Great sounding Audio " reports also. Neither one of my Antennas is over 38 feet off the ground. The beam at 38 feet and the Vertical at 20 feet. I'm pretty happy the way this little 830 turned out. Now, It's time to sell it and purchase another 830 to repair and make new again.
73,
Gordon

Good day to all folks. Traditionally, I am a CW operator; when I hit my straight key in this case without using the RIT, I see my dial that jumps from ej. 14.025 to 14.026.8. To avoid this, I am forced to use the RIT always. Any ideas on what could be the problem?

Thanks to all and may you have a nice day

9711. TS-520 audio system followed by some opinions and mods. N9WB

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-01 11:21:43 UTC
From: Walter A. Breining
Topic: 9711 Message: 9711

The following has been posted in the "Files" section of this group
under "Mods"

Below is a discussion of the TS-520 audio system followed by some
opinions and mods:

Note:
I was sent a list of mods for the TS-520. "Here are just a few mods
that I designed for my 520." These must be for another rig than the
TS-520. These will not work on the 520!

TS-520 transmit audio system.

Processor off:
Generator Board.
Transmit

The microphone audio enters on pin 1 of the microphone connector
where it is connected by a coaxial cable to the MIC terminal on the
Generator board.

From MIC, it is then coupled through C-14 (1 uf) to the base of pre-
amp Q-3.
From the collector of Q-3 the audio passes through C-17 (. 1 uf) to
the base of Q4.

High frequencies from the collector of Q-3 are bypassed to ground by
C-16 (.01 uf).

Q-4 is an emitter follower circuit. In such a circuit, the output is
taken from the emitter and is a relatively lower impedance output.
(Impedance around 2 K ohms).

From this emitter output passes through C-43 (1 uf) to D-18.

When the processor is off D-18 acts as a switch on the on position
and passes the audio to C-44 (3.3 uf).

This signal then is routed to the MV-1 terminal on the Generator
board to the mike gain control input via a coaxial cable.

From the mike gain control output, the audio signal returns to the
Generator board via a coaxial cable through terminal MV-2.

The audio signal then passes through C-37 to the base of Q-6. The
collector of Q-6 is directly coupled to the base of Q5 and the
collector output of Q5 passes through C-40 (10 uf) to Generator board
terminal MAO.

From MAO the signal passes through a coaxial cable to the mode switch. When the mode switch is in USB or LSB position, the audio signal is then routed via a coaxial cable to BM on the Generator Board. This feeds this audio signal into the Balanced modulator where the DSB signal is produced and later filtered to SSB on the IF board.

Processor on:

*When the processor is on, D-18 now acts as an open switch and no longer passes the audio signal to C-44.

Instead, audio passes through C-18 (.047 uf) to the drain circuit of FET Q-7. FET Q7 acts as a voltage controlled variable shunt resistor and shunts the audio level to ground by way of C-20 (100 uf) depending on the DC voltage applied to its gate.

This controlled audio signal is then applied to the very high impedance input provided by the gate of FET Q-8. Q-8 is a source follower and provides isolation between the processor control circuit Q-7 and the input of Q-9. The controlled audio from the source output of Q-8 passes through C-26 (.01 uf) to the base of Q-9.

The collector output of Q-9 is DC coupled to the base of Q-10. The collector output then feeds the controlled audio signal to VR-3 through C-30 (3.3 uf). The controlled audio from the output of VR-3 then passes through C-33 (3.3 uf) Through D-17 to MV-1 the input of the Mike gain control.

VR-3 provides a means to adjust the peak output of the controlled audio that goes to the mike gain control to match the audio with the processor off.

D-17 and D18 switch the input of the mike gain control between processed audio and unprocessed audio. D-18 connects the unprocessed audio to the mike gain control when the processor is off.
D-17 connects the processed audio to the mike gain control when the processor is on.

From this point the controlled audio follows the same path from the mike gain control into Q6, Q7, through the mode switch and into the balanced modulator in the same manner as the audio from the mike gain output does with the processor off.

Processor DC control system.

Audio is sampled from the collector output of Q-10 by way of C-31 (.47uf) and into buffer amplifier Q-11. Push-Pull audio is provided from Q-11 by getting audio from both the collector and emitter of Q-11. This is coupled by C-32 and C-33 (both 3.3 uf) into a bridge rectifier circuit consisting of D-13, D-14, D-15, and D-16.

The DC output of this rectifier connects to the base of Q-12. This DC voltage is dependent of the audio level at the collector of Q-10. This voltage is then amplified by Q-12 a DC emitter follower

amplifier.

The DC output of the emitter of this amplifier connects to the gate of FET Q-7. As described earlier, FET Q7 acts as a voltage controlled variable shunt resistor and shunts the audio level to ground by way of C-20 (100 uf) depending on the DC voltage applied to its gate from Q-12.

C-55 and R-37 provide a time constant that is very fast but not instantaneous. This allows the compressor to attack quickly but not so fast as to create distortion. C-35 and R-34 serve as a release time constant that provides a slower release time, depending upon the duration of the input peak.

Discussion and opinions:

I personally classify SSB transmit audio in one of three very general categories.

1. DX audio:
Many extreme DX enthusiasts find that a narrow, middy audio sound that is higher on the high end of their narrow bandwidth is favorable when operating DX. This cuts through pile-ups and noise quite well. For the rather short transmissions of most DX contacts, this is not particularly annoying and provides for clear transmissions of signal reports and other basic information. The Heil HC-4 element provides this sound and is popular with serious DX enthusiasts.

2. Rag chew audio:
This is the audio that most Amateurs wish to achieve. It is natural, clear, but yet has enough articulation to be well understood. Ideally it will have some lows but not booming bass and highs that extend to anywhere from 2400 Hz to 3000 Hz or so. The Heil HC-5 provides this kind of audio.

3. ESSB audio. This audio is absolutely beautiful when listened to on a high quality receiver. It has lows below 100 Hz and highs up to 3500 Hz and sometimes beyond. To achieve this, the Amateur must have a rig that generates its signal by Direct Digital Synthesis. These operators usually use a RF amplifier and several thousands of dollars of audio processing gear. The RF amplifier is necessary because this type of signal does not have a high RMS content. These operators pay particular care to be sure that their equipment and their amplifier has very low IM and harmonic distortion so their signal sounds very clean.

Since DX audio is much narrower than the stock TS-520 is capable of, modifications to the transmit audio is a non issue with DX audio

People perusing ESSB audio usually feed the audio output from their rack of processing gear directly into the balanced modulator. This makes modifications to the transmit audio circuits prior to the

balanced modulator a moot issue. There are many rigs much more suited to this endeavor than the TS-520.

So my discussion is going to be with regard to the pursuit of very good rag chew audio. This is what most people reading this are really seeking,
In articles, capacitor changes have been recommended for the TS-520. While some of these may be helpful, others extend the frequency response beyond that which the IF and filter are capable of and are of no use to most Amateurs.

I do believe that the following changes might be helpful.

Generator Board:

C-16 Change to .001. This capacitor shunts the collector of Q-3 the mike pre amp transistor to ground. This shunts higher frequency audio tones that are well within the radio's audio bandpass to ground. This change will make the transmitted audio have slightly more articulation and sound more open.

C-17 Change to a value of 1uf or 2.35 uf.
If a 1-uf non-polar capacitor is available use this.
If a non-polar capacitor is not available make one using two 4.7 uf capacitors. Connect the two negative leads together and use the remaining positive leads to connect where the original capacitor was connected. The two negative leads connect only to each other.
This capacitor couples the audio to the base of Q4, the second mike pre amp transistor. This change will keep this capacitor from reducing the low frequency response.

C-37 Change this value to 1 uf. A non-polar capacitor is not needed here. Place the + lead to the foil that connects to the base of Q-6. This capacitor couples the output of the mike gain control to the input (base) of Q6, the first driver for the balanced modulator.

Read thoroughly before making the next changes: I DO NOT RECOMMEND THIS NEXT CHANGE

There are also 2 changes that will increase the low frequency response of the processor circuit.
C-22 and C-26 can be changed to 1 uf. If a non-polar capacitor is not used, the + side should go to the Q-8 base and Q-9 base respectively.

With the original values (.01), when the processor is energized, the brightness and articulation of your audio will increase. I believe that it is best to leave the circuit this way.

Consider this:
When you turn the processor on is when you need more punch. An increase in brightness will be beneficial at this time.

So I would leave this alone. But I provided the information so you can decide.

There are some 1 uf capacitors that some people might suggest changing to higher values. I do not believe that changing these will make any difference unless you are running an audio rack. If you were running an audio rack, you would benefit more from feeding the balanced modulator directly than making these changes.

Receiver:
Generator board

The demodulated receive audio leaves the balanced detector (product detector) at the Det pin on the Generator board and is fed to the Det terminal on the AF unit board via a coaxial cable.

AF unit

The demodulated receive audio leaves the balanced detector (product detector) at the Det pin on the Generator board and is fed to the Det terminal on the AF unit board via a coaxial cable.

It then passes through C-14 (.47 uf) to the input (base) of Q5. Audio from the output (collector) of Q-5 passes through C-13 (.047 uF) through pin AV-1 to the input of the AF gain control via a coaxial cable.

From the output of the AF gain control, the receive audio passes back to the AF unit through AV-2 via a coaxial cable and then through L2 a RF Choke (3.3uh) and through C-1 (4.7 uf) to the input (base) of Q2. Q2 and complimentary transistors Q3 and Q4 comprise the audio output amplifier that provides the speaker and headphones with high level audio.

A word about receiver audio:

Except when receiving strong ESSB signals, we have to look at SSB receive audio differently than we would high fidelity audio. Unfortunately, our received H.F. SSB signals are accompanied by various noises. The wider that we open the receiver frequency response, the more noise that we will hear.

With some noises, such as static crashes, slightly extended high end will actually soften these sounds making them more tolerable even though you are hearing more of them. However, this same extended high frequency response will make adjacent frequency splatter less tolerable.

With the low frequency response extended, strong full signals sound more pleasant, but lightning crashes will be much more annoying.

So you must ponder what it is that you wish to achieve.

To increase the low frequency response:

Change C-13 (.047) to 1 uf. The + lead of C-13 should go toward the collector of Q-5 if the replacement is polarized.

Change C-14 (.47) to 1 uf. The + lead should go to R-16 (3.3K orange, orange, red). This resistor leads to the base of Q-5.

Change C-8 to as high of a value as you can up to 2200 uf. Be sure that the voltage is the same or greater than the original. Be VERY sure to have the + side of the junction of R-11 and R-12 as was the original.

For extended highs:

Change C-27 (.01) to .001.

Choice of speaker and headphones is important. I prefer a 6 or 8-inch speaker in a wooden open back baffle. Wooden speakers from the olde inexpensive stereos that had turntables in them often work. The Goodwill store, flea markets, and roadside shopping on trash day often yields bargains. A capacitor that is in series with the speaker can be switched in and out to turn the extended lows on and off. This can be located in the speaker.

Another word about radio modifications:

Do not feel like you have to do every modification that you hear about. There are two kinds of modifications.

Necessary modifications:

These correct serious factory production or design errors. Such is the case with the reversed wire connections on the MC-60 mikes.

Modifications for preferences:

These are unnecessary and are only done to make a rig match your preferences. The changes I have listed here fall into this category. Consider your level of competence before attempting any modifications. The TS-520 works great as is. The olde adage "if it ain't broke, don't fix it" is good advice.

This paper was in response to some inquiries about modifications to the TS-520 transmit and receive audio circuits. It is also useful in tracing and understanding these circuits.

I am not responsible for Murphy's law or any disasters. Modify at your own risk!

Chris,

Using the MC-50 with my TS-830 requires that the mic gain be turned full clockwise. It appears to work just fine, though. If that's what you're seeing, you don't have to change mics.

Excuse me but I have the MC-50 and the 830. My mi gain is turned up just enough for the VOX to catch and Delay just enough to drop it when I'm done. The processor ITurn on not even enough to make the meter swing the 20 db like the book says. I don't push it that far since I don't need it.

Now I just found this. Thought I'd stop and check it out. Respectfully. Thanks.

Which stand does your D-104 have. Is it amplified or un-amplified?

Subject: [TS-520_820_530_830] Best mic for 830s?

Hello, I just picked up a Kenwood 830s this last weekend. The mc-50
was bad will not drive the radio. I have a D104 that works, but I
understand I may have impedance matching problem. Looking on Heil web
site I see they have a kit for the D104.Or is it just better to get a
new mic?

I do like my D104 it looks cool.

Hi Chris,

I have a MC-50 and I have heard that two good mics that work good on the Kenwood Hybrids is the D-104 as you have and the Shue 444. Someone else reported that they use a Heil Goldline thru an equalizer. I use the standard MC-50 without the stand. I just plug it directly to the jack of my 830. Mine is starting to go intermittent. I have considered the possibility of trying to use Astatic D-104 in the future. I know of someone who has used one on thier 520 some time back.

I inqired to that person about it, having been a ham being my elmer and he told me with the older rigs like these, you need to keep the impedance up higher.

Now a D-104 mic as I've seen can be wired numerous ways and can be purchased rather easily since there is still many available for a reasonable price.

Any of the three should and as I've heard on the air and by visitation to various operator positions, work well.

I like you like the lollipop design, however when the operating environment gets cold you may find it a little cold on your hands to handle. My previous shacks have been operated under such conditions in the past. Something to think about whichever mic you choose.

See you on the air.

From: John Harp
Topic: 9664 Message: 9718

Well you are correct that not all accessories may not wire directly to the 520 and function as you would with the 830. But to get a feel for the radio and its differences to operate by comparison is what I was referring to. My apologies to the misinterpretation otherwise.

As far as the radio going that far out in price. I'd wait until I found one going a bit cheaper. For example: My second 830 I bought from the daughter of a ham that was no longer in good health enough to opertate his CW. His daughter (then becoming POA) recognized his financial need and that he could no longer use and enjoy his station then posted to e-bay his gear one by one. I bought his radio as the high bidder for 325 US dollars, by winning bid. I talked with her via e-mail a little.

I watched for a while to find a good deal as my first one was off the air for about a year. It takes time to find a good deal on these radios. Be patient and watch and bid carefully for the radio you desire.

KE5EOT <ke5eot@...> wrote:
Remember, the accessories for the 520 S and SE series may not work on

Jim, this may sound a little silly comming from me another 830 owner, but have you gone thru and clened the 830 recently. Many times that helps resolve the problems for me in both my 830's in the past. It may be worth a try, before you send it away. I find a good cleaning has helped me see the interior and know it well on a routine basis. You may already have and I just don't know it. Just a suggestion.

Jim Stoneback <jstonebk@...> wrote: One last try before I ship it to a repair shop. Has anyone fixed this
problem before?

My TS830s has no sidetone, thus no semi-QSK CW.

With MON switch on, key depressed, there is no sine wave at TP1, no qsk, no
CW output.

I injected a tone at TP1 and get sidetone, semi-qsk action and CW output.

I checked all the components in the sidetone circuit with no bad components
found; replaced transistor and zener anyway, to no avail. My confidence is
shaken. Help!

Hi Art,
I used my scope to adjust it to a minimum. I found that the setting
was still at the minimum spot even after changing the PD Diodes.
Trust me, it is a VERY low voltage. I had to use a 1X probe to be able
to even read it well. My 10X probe would not show enough deflection.

Thanks Rick,
I also appreciate you selling me the Diodes.
Walt was wondering if they were matched. I didn't check them, I just installed them and checked the Carrier adjustment. I had to tweak L19 and L20 just a bit but the Carrier balance was still right on. I am now debating whether to go ahead and swap out the Balanced Modulator diodes as well.
Were the Diodes matched ? They sure do work nice in the 830.

Thanks again,
Gordon

Good Morning Luigi,
On the 830, the frequency should change 800HZ when you transmit.
This is so you and the staion you are working are Zero Beat (or close)
Now if yours is changing 1.8 Khz, then something is Wrong.
Is this something that just started, or have you been operating this
way all along ?

73,
Gordon

That's Correct Rick. Also, you could tune up at 14.175 into a dummy load for full output, then Reduce the mic gain to ZERO, turn the RF sensitivity on the back all the way up, place the rig in LSB and key the rig if the carrier is unbalanced, it should show a reading on the RF meter in the rig.If it does, adjust TC3 and VR4 for minimum, then switch to USB and do the same thing until you have both USB and LSB at the minimum spot.
A scope makes it so much easier to do however.

Thanks for your reply. The VTVM I am using has a 1.5 volt range so I would think I would see some indication on the meter but nothing. Maybe like you say the VTVM does not go low enough. I am not sure but we changed out the diodes in the product detector and balanced modulator also and was wondering if that had anything to do with not getting an indication. We also put a .001 capacitor in the C106 position and added the 100 resistor. Any other ideas?

I took the MC-50 out of the stand and it looks like it is working much better.
Maybe ok after all , I will change C106 this week. If I can locate one.

Thanks
Chris..

John Harp <ka3dpw@...> wrote: Hi Chris,

I have a MC-50 and I have heard that two good mics that work good on the Kenwood Hybrids is the D-104 as you have and the Shue 444. Someone else reported that they use a Heil Goldline thru an equalizer. I use the standard MC-50 without the stand. I just plug it directly to the jack of my 830. Mine is starting to go intermittent. I have considered the possibility of trying to use Astatic D-104 in the future. I know of someone who has used one on thier 520 some time back.

I inqired to that person about it, having been a ham being my elmer and he told me with the older rigs like these, you need to keep the impedance up higher.

Now a D-104 mic as I've seen can be wired numerous ways and can be purchased rather easily since there is still many available for a reasonable price.

Any of the three should and as I've heard on the air and by visitation to various operator positions, work well.

I like you like the lollipop design, however when the operating environment gets cold you may find it a little cold on your hands to handle. My previous shacks have been operated under such conditions in the past. Something to think about whichever mic you choose.

See you on the air.

Hi Gordon,

When I ordered them, I stipulated to the guy on the phone I wanted 1% tolerance if he had them. I had wanted 1N6263 diodes as listed in AG6K's article, but he told me the 1N5711's were very good...and had a higher voltage rating. He was right ...The junction resistance and capacitance differences are nill. I used a B&K 810C and a Fluke 77 which are supposed to be accurate to .5% (that is 'point' 5%) so the diodes are matched close enough for our use. The only problem ordering them is dealing with the minimum order most electronic sellers have. You probably won't need 25 or 50 of them.

73' Rick KC0HH

Gordon <n6wk@...> wrote: Thanks Rick,
I also appreciate you selling me the Diodes.
Walt was wondering if they were matched. I didn't check them, I just installed them and checked the Carrier adjustment. I had to tweak L19 and L20 just a bit but the Carrier balance was still right on. I am now debating whether to go ahead and swap out the Balanced Modulator diodes as well.
Were the Diodes matched ? They sure do work nice in the 830.

Thanks again,
Gordon
N6WK

> I am glad you saw the same improvement I did. I have been amazed since I did the Shottkey mod on my 830S....The noise floor is definitely better and the 830S' white noise level doesn't give me a headache while listening with headphones now. I think after you make the diode swap, the lack of phase noise in the 830S' receiver lets you hear more signals.....The Shottkey diodes are a cheap fix.

Hi everyone, In my instruction manual for the TS-830S says to
neutralize at 28.500. Now in the service manual it says to use 28.800.
My question is which is correct?

Art,
I always use 28.800 and have had NO problems using that frequency.
You are correct, the user manual and the service manual do differ on that.

9733. Re: TS830 Problem

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-01 21:01:53 UTC
From: w5rkl
Topic: 9685 Message: 9733

I suspect the problem is in the sidetone oscillator keying circuit or the sidetone oscillator itself.

My recommendations are to use an o'scope. Ohm meters can't tell whether a capacitor is good or not. An ohm meter usually can only detect a shorted capacitor. Ohm meters can not provide sufficient voltage to show capacitor leakage. There are, however, DVM's that can tell the capacitance value but the capacitor must be out of the circuit. I don't trust them when the capacitor is in the circuit, too many other components in the circuit that can contribute to confusion with the reading.

Checking transistors in a circuit is difficult. Normally, for example, a PNP transistor will have a more positive voltage on the collector when it is not conducting but a much less positive voltage when it is conducting. The opposite voltage polarity is true with an NPN transistor. The arrow on the component symbol determines the type of transistor, PNP or NPN.

The base biasing circuit should show a change with keying. If it does but the collector voltage remains unchanged, then more than likely the transistor is bad. This can be seen very easily with an o'scope.

Another helpful hint is to understand how the circuit works before attempting to troubleshoot. Most Kenwood manuals have a section that discribes the circuit operation which may point you in the right direction.

I am, however, curious about the TP1 audio injection you are doing. Maybe you could provide a bit more information. Also some additional information outlining the steps you are taking to determine failed components etc. We're all here to help.

If I can further assist you, feel free to drop me an email.

73's,

Mike

9735. Re: [TS-520_820_530_830] VFO 230 vs 240 for 830s?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-01 23:05:41 UTC
From: John Harp
Topic: 9650 Message: 9735

To be honest with you Kieth I found the performance of the VFO- 230 to work good. The noise you refered to hasn't been a problem to me.

I watched e-bay last year for sometime bidding carefully on both. The 230 I got highest bid on first.So far it's needed to be turned off now and again to reset it and there is one LED out on it. But other than that it's been just fine.

I must admit, I like having the 5 memories and being able to program a few standby favorates. The split transcieve is good on both 230 and 240. I found as my sight got worse the digital display is a help too. Sometimes I keep one frequency on the 830 while I wander the VFO along.

They say the Vfo's rate of change of frequency can be altered. I have not looked into it yet as I have not had time to find out if it would be worth it.

You asked for my opinion as also others. That's my experience with it.

"Darwin, Keith" <keith.darwin@...> wrote:

I've assumed the VF0 230 would degrade RX performance in the 830s since
it is a synthesized VFO and would create problems with synthesizer noise
that the regular VFO doesn't create. If I'm right, won't the VFO 240 be
a better choice for top-notch receiver performance ?

What's the general consensus about which VFO to use with the 830s?
There are clearly a lot more 230s than 240s.

Subject: Re: [TS-520_820_530_830] Best mic for 830s?

Chris,

Using the MC-50 with my TS-830 requires that the mic gain be turned full clockwise. It appears to work just fine, though. If that's what you're seeing, you don't have to change mics.

73,
Jim K4AXF

Which stand does your D-104 have. Is it amplified or un-amplified?

Subject: [TS-520_820_530_830] Best mic for 830s?

Hello, I just picked up a Kenwood 830s this last weekend. The mc-50
was bad will not drive the radio. I have a D104 that works, but I
understand I may have impedance matching problem. Looking on Heil web
site I see they have a kit for the D104.Or is it just better to get a
new mic?

I do like my D104 it looks cool.

Yep, unless you have the document for the MC-50 there's no way to tell
it's both a high and low impedance type mike. So, if you're running a
MC-50, and you have to turn the mike gain up most of the way on your rig,
unscrew the back end of the mike connector, turn it 180 degrees, and
screw it back in. This assumes that the mike cartridge and/or the
internal mike wiring and/or the mike cable do not have a problem.

From: w5rkl
Topic: 9691 Message: 9741

Are talking about carrier null or sideband balance? There is a difference.

Carrier null is adjusting the output of the balance modulator to the lowest possible level and has nothing to do with sideband balancing.

Sideband balancing is adjusting the output level of the sideband crystal controlled oscillators so they are equal and has nothing to do with carrier null.

Sideband balancing "balances" the output of the sideband generators so they are equal. That's why you have to switch between USB and LSB until both sidebands have equal output. This adjustment works like the "balance" control on your stereo. Incorrectly adjusted sideband balance control will cause one sideband be louder than the other.

Carrier null, "nulls" or "reduces" the carrier output of the balance modulator to it's lowest possible level. This adjustment is like a squelch control. Incorrectly adjusted carrier null controls will cause a constant carrier to appear along with the sideband RF output at the receiving end. I've seen incorrectly adjusted carrier null controls produce between 5 and 10 watts of steady carrier output with or without sideband output. This carrier will not change in amplitude except with QSB.

I would recommend performing the sideband balance first then follow on with the carrier null control.

When I make the sideband adjustments, I use a 1KHz tone fed into the microphone, adjusting the mic gain and watch the transmitters ALC meter for proper level, then adjust the sideband balance for equal output levels. You can montor the levels using a monitor scope such as an SM-220 or a good Heathkit SB-610 monitor scope. If you don't have a scope then either a seperate receiver with a VTVM connected across the receivers audio output or an sensitive RF meter. Adjust for equal readings in both sidebands.

When I adjust the carrier null, I also use a seperate receiver. Tune the receiver to the transmitters frequency and zero beat the frequency. Set the mic gain to complete counterclockwise position, mode switch in either sideband, key the transmitter by pressing PTT or flipping the SEND switch. Tune the seperate receiver slightly off the transmitters frequency and adjust the carrier null controls for as low a carrier signal as possible, as heard through the seperate receiver. Do not directly connect the seperate receiver to the transmitter under test, you could damage the receiver. If you do not have a seperate receiver, you can use an sensitive RF meter. Again, adjust for minimum

reading. A good SWR meter between the transmitter and dummy load set
to FWD and maximum sensitivity can be a substitute for a seperate
receiver or RF meter. I don't use the RF meter on the transmitter,
they are not sensitive enough. A good Field Strength Meter properly
adjusted can also be used.

Art is trying to adjust the carrier null on the balanced detector in his TS-830 receiver. The procedure is to look for a signal from the carrier oscillator at the IF out jack on 8.830 MHz. Then adjust TC-1 for minimum. This signal is so low of a level he is having trouble seeing it. I usually use a receiver tuned to this signal and null it that way. Art does not have any such receiver available, so we are looking for another way.

Jerry:

There are two solutions to this QRP operation.

The first can be found in the files section of this group, under Mods, then Use ALC to force QRP operation. This is a good way to do this.

Another method, depending on how low you wish the output to be, you can lower the final screen voltage. This can be done by adding a series resistor in series with the wire that goes to the SG point on the final unit. A 12K resistor will create about 40 w PEP. This is what I did to make my TS-820 drive my Collins Thirty S One amplifier that required 40 W input drive. I added a toggle switch on the back to bypass this added resistor for full power when I was not using the amp.

For lower QRP. Disconnect the wire from the SG pin and Ground the SG pin. Do not ground the wire as this is a voltage source. A toggle switch can be used to switch the SG pin between the wire with the screen voltage and ground.

If you are wanting QRP on CW, just reduce the carrier control.

On SSB reducing the carrier control will not change the output. Reducing the mike gain will, but if it is reduced below the ALC threshold, the output power becomes very erratic unless you are using an external compressor.

As far as a Kenwood net and rag chews with Kenwood users and others, please join the Yahoo Group KenwoodQSO.

When I did the carrier balance adjustment on my 830s recently, I ended up with a rig whose minimum output on CW was 25 watts. I went back and checked the carrier balance and found that while I had indeed nulled it for LSB, it was not nulled on USB. I followed the book this time, adjusting both USB and LSB to minimize them equally. Neither was totally nulled, but both were pretty low. Since then the CW carrier will go from 0 to a tad over 100 watts just like it should.

I did my adjustment by monitoring on a separate RX. It worked very well.

- Keith KD1E -

Hi Walt,
It has been a while since I had a MC-50 mic, but aren't there red dots on the two connectors you line up for high impedance? If I remember right you have to orient the connector on the rear of the mic itself as well as the one to the base.

Yep you are right Rick. From my personal experience I got higher output on the high impedance setting (red dots) but a more mellow sound and lower output on low impedance (black dots). Not an issue if you are running an amp.

If he has access to or can borrow a 10Mhz or higher scope, that would be much better than an RF probe and a VTVM. It's possible his RF probe and/or VTVM is not sensitive enough to pick up the weak signal. Just a thought.

Hi Jerry,

I have the first year edition of your rig, the TS-820. Can the TS-820 and 820S do QRP? - In stock form, it's sort of a mixed answer. On CW it can easily do QRP, by just turning the carrier level down until your output power (as viewed through a wattmeter) is at QRP levels (it's recommend though, that you retune the finals afterwords, for the cleanest signal).

As for SSB - wellllll, yes and no. Technically you could just run down the mic gain, until your voice peaks are at QRP level. The only problem with this although, is that you will have lousy audio. The best way to do SSB QRP with the 820 (or any other of the Kenwood hybrid rigs for that matter), is to trick the ALC, by introducing a voltage to the ALC pins (used for keeping the ALC within limits, when you're using an amp), on the acessory plug on the back of the radio. Oftentimes, all you need, is just a 9 volt battery (which may or may not need a potentiometer with it to adjust the voltage). This allows you to run full audio (as in normal mic gain), and basically vary how much drive you're feeding from the 12BY7A to the finals, hence setting your RFoutput power.

73,
Ellen - AF9J

You are correct Clif.
I figured that since Art had swapped out his Balanced Modulator Diodes
also, He would need to know how to do the Transmit side as well as the
receive side.
Sorry if it became confusing. My fault for not being clearer.
TC3 and VR4 are for the Transmit side adjustment .
TC1 is to adjust the receive part. As Clif pointed out, Totally
different procedures.

73,
Gordon

My 830s developed a raspy sidetone that was caused by a bad resistor on the rectifier board. In my case the resistor didn't open, it just changed value. I believe this resistor supplied the STB voltage. The resistor failed because of a QRO mod someone had done before I owned the rig. Hope this helps.

Yes Pete,
The components on the Recifier board are common failures. I have
found many open or changed value components there on the 830 and the
820. It is always a good place to start looking when diagnosing a
problem on these rigs.
I had suggested that Jim check R-12 and R-13. He found R-13 was
open. He replaced it and his rig is working great again.
73,
Gordon

Does anyone have an extra paddle for a switch for the 520/820/530/830 series? I have a 520s that has lost a paddle. The switch is ok.
Let me know. be willing to buy one.
Thanks....73 Dave W0DLR

Chris,

I use a Behringer XM8500 feed into a Behringer VX2000 processor and
then through a Behringer PEQ-2200 parametric EQ. This feeds the
balanced modulator directly. Very cool sounding.

Hi Kevin,
What do you mean " I keyed the radio and the Grid current went off the scale" ? Are you referring to Plate Current ?
How are you measuring Grid current while Keying the rig ?

Just Curious and trying to get more info to help you out.

When you replaced the resistors did you use 1/2w 20 ohm carbon comp?

The metering circuit could have taken a hit and be indicating wrong.
Check the resistors in it also.

Kevin,
What does your ip meter show for idle bias in USB when you key the
mike ? Is it set to 60ma ? What does the ALC and the plate current
read in Tune mode? What does your plate voltage show? You might want
to hook up a transformer saver while you figure this out. There is
directions on building one in the Files section by Walt N9WB.
What brand and number tubes did you install? The chinese 6146's are
known to Short/Flash so they are not a good choice.

I bought a VFO-230 a couple of months ago for $200, and
managed to get one in mint condition at that price.

9770. TS-830S & RTTY

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-03 17:57:41 UTC
From: Jeroen
Topic: 9770 Message: 9770

Hi group,

This year I will be one of the operators on a Jamboree On The Air station (PA3HEB/J). I was planning on doing some RTTY and maybe PSK31, but mainly voice of course (in The Netherlands scouts are allowed to handle the mic or keyboard themselves, under supervision of a licensed ham). Audio connections between rig and PC will be through 1:1 audio transformers.
What are the best settings for mic gain, compression (probably off)? Should I reduce output power, and if yes, should I do this tricking the ALC (transverter jack) or by lowering the mic gain? Can xmit-rec switching be done with vox?

Tnx
73 de PF1JM

Gordon - The idle bias is now up around 150 mA. I had it adjusted to
60mA before I started having problems. I re-adjusted it down to
60mA. Plate current still off scale.

Plate voltage is about 925 volts without load.

Ip in TUNE mode reads 130mA

ALC in TUNE mode reads about 2/3rds deflection within the ALC bracket
with the carrier control at approximately 9 o'clock position.

The replacement tubes are Sylvania brand 6146B's.

Clif - I used 20 ohm, 1/2 watt, metal film resistors, instead of carbon comp, based on some info from an 830 restoration site I located on the web. I'd be interested in your thoughts on using metal film vs. carbon comp.

I made reply to Gordon with some current readings. It appears all current readings are showing higher than they should. I'll check the metering circuit and let you know what I find.

Ok, Yes that is High. My 830 is only running 75 ma in tune position.
Ok next question, What do R7 and R8 ohm out at under the finals ? they should be 100 ohm 1/2 watt. Did you replace those as well as the 20 ohm 1/2 watt resistors ?
Also, as Clif mentioned, check the resistors R6 and R10 in the final section as they are the resistors for the Meter IP.
Also, how is the bandswitch coupler inside the Final cage? Is it broken? Cracked ?
Can you take some voltage readings from the Final board for us? If so, What is the voltage on the SG terminal, then on the DRV terminal also the FG terminal.

Well for sure you will want to run with compression OFF, You should be able to control the drive and ALC by using the sound Card output. I wouldn't want to see more then maybe 25 to 30 weatts output on peaks on RTTY.
I do not believe that the Transmit/Receive can be done with Vox, I would think a Foot switch would be the best way to key the rig . It is easy to wire cables from the Computer sound output and line in to the 830's mic and speaker connections. The 830 User manual describes how to run AFSK with the 830 on page 25.
73,
Gordon

From: David Rust
Topic: 9775 Message: 9775

Guys, I ran across an 830s in VERY NICE condition with new tubes but low output. Priced at $250. Is that reasonable? I need another radio like a knot on the head, but I would like to have an 830s.

Yes,
That is a reasonable price for a Very Nice 830 with a minor Problem.
Buy it, we'll help you fix it.

73,
Gordon

I run PSK and RTTY on my TS830 all the time. I tapped off the rx audio before the AF GAIN pot so I get a fixed level going into the sound card. T-ing off the speaker out will work just as well just keep the levels set right in your computer mixer settings. I never use the compression and I run the mic gain at 4. I get very good signal reports as to the signal quality. I usually run about 40W out and have good luck.

Gordon - I did replace R7 and R8 at the same time as I replaced the
others. I checked them out of circuit and they are still 100 ohms.
No signs of heating or cracking.

I am familiar with the problem of the cracked shaft couplers on the
bandswitch. These don't show any signs of cracking. I assume
someone must have replaced them somewhere along the way.

I will check R6 and R10.

You might give me some guidance on checking those voltages on the
final board. I don't have any problem making the measurement, but
tell me what condition the transmitter should be in when I'm taking
the reading. I'm refering to things like mode switch position, TX or
RX, etc.

From: Julio VE3FH
Topic: 9770 Message: 9779

I used my TS-830S on RTTY for years and the vox never worked right to control the tx/rx, it was quite unstable. A foot switch like Gordon says is a very good option. For ragchewing you can use the send switch in the front but this is a pain for contesting or pile-ups. Personally I prefer to control the PTT line with MMTTY or whatever software you use for RTTY, the interface is a simple transistor.

I followed the recommendation in the manual and always kept the plate current below 165mA, depending on the band this would give me not more than 30W out. Occasionally I went above that to break some pileups but never for long because the risk of damaging the finals

I kept the speech processor off at all times for RTTY.

73,
Julio VE3FH

I checked R6 and R10. They are within spec.

Kevin

Kevin, ,
lets start on any band in receive. I just want to get some base line
figures. I would suggest doing it with the heaters on. Adfter you
get those, we can evaluate them and go from there.
Also, BE VERY CAREFUL, there are lethal Voltages in there as I am sure
you are aware, even when just receiving. Always keep one hand behind you.

Gordon

Ok, Great.
We'll diagnose this thing, component by component.. hi hi..

Gordon

SG = 267V
FG = -104V
DRV = I was able to see a very low level AC voltage, about 200mV. It appeared to be unaffected by meshing the drive capacitor.

9785. Alignment Tools

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-03 21:40:40 UTC
From: Gordon
Topic: 9785 Message: 9785

My alignment tools are all plastic and are getting well worn. Can someone suggest a place that sells good quality non-conductive tools for adjusting Coils and Caps ? Anyone tried the Ceramic tools ?
I know better then to try to use metal (The slugs break) and conductive bites ..

Gorodn

Rick,

If you have any extra left. I would like to get enough to do the mod on my TS-830S.

Thanks,
Walt, KA2NJF

Subject: Re: [TS-520_820_530_830] Re: TS-830S Product Detector Mod

Hi Gordon,

When I ordered them, I stipulated to the guy on the phone I wanted 1% tolerance if he had them. I had wanted 1N6263 diodes as listed in AG6K's article, but he told me the 1N5711's were very good...and had a higher voltage rating. He was right ...The junction resistance and capacitance differences are nill. I used a B&K 810C and a Fluke 77 which are supposed to be accurate to .5% (that is 'point' 5%) so the diodes are matched close enough for our use. The only problem ordering them is dealing with the minimum order most electronic sellers have. You probably won't need 25 or 50 of them.

73' Rick KC0HH

Gordon <n6wk@... <mailto:n6wk%40n6wk.com> > wrote: Thanks Rick,
I also appreciate you selling me the Diodes.
Walt was wondering if they were matched. I didn't check them, I just installed them and checked the Carrier adjustment. I had to tweak L19 and L20 just a bit but the Carrier balance was still right on. I am now debating whether to go ahead and swap out the Balanced Modulator diodes as well.
Were the Diodes matched ? They sure do work nice in the 830.

Thanks again,
Gordon
N6WK

since I did the Shottkey mod on my 830S....The noise floor is
definitely better and the 830S' white noise level doesn't give me a
headache while listening with headphones now. I think after you make
the diode swap, the lack of phase noise in the 830S' receiver lets you
hear more signals.....The Shottkey diodes are a cheap fix.

From: Jim Stoneback
Topic: 9685 Message: 9787

Gordon made a believer of me; check the rectifier board components. When I was checking the sidetone circuit, I removed each component and measured it either with DVM or my capacitor meter. The zener I checked by setting up a little circuit on the bench to see if it regulated at 9 vdc. I was really discouraged when all the parts checked out OK. I went ahead and replaced the transistor and zener diode anyway, to no avail until I checked and found R13 open. Now everything works hunky dorry. And I saved the cost of a repair plus 2way shipping!

73,

Jim K4AXF

Yes Pete,
The components on the Recifier board are common failures. I have
found many open or changed value components there on the 830 and the
820. It is always a good place to start looking when diagnosing a
problem on these rigs.
I had suggested that Jim check R-12 and R-13. He found R-13 was
open. He replaced it and his rig is working great again.
73,
Gordon

9788. Re: TS-830S Excessive Grid Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-03 22:30:11 UTC
From: Gordon
Topic: 9760 Message: 9788

Hi Keith,
Ok, Those voltages look OK in receive. Just what I would expect to
see in a normal working 830.
Did you build the Transformer saver?
The reason I ask is that I want you to take some measurements while in
Transmit mode Very quickly, But I don't want you to burn anything up.
I also forgot, Do you get ALC readings in tune? I think you said Yes
before. Next question, what kind of Ouput do you get when it's all
tuned up?

Gordon

Rick, Where did you purchase them from? I might just make an order, then I can sell them back to the guys in small quantities ,as you are doing. Not for Profit, just for convenience and to help out.

73,
Gordon

And you have the feeling of Satisfaction of Fixing your own Rig. It's a GREAT feeling.
I was thinking of having Kevin check the components on the Rectifier Board. It only takes a few minutes and is well worth the effort.

From: Darwin, Keith
Topic: 9775 Message: 9791

No, I don't think that is reasonable - it is a bit too low :-)

- Keith KD1E -

Subject: [TS-520_820_530_830] TS830s

Guys, I ran across an 830s in VERY NICE condition with new tubes but low output. Priced at $250. Is that reasonable? I need another radio like a knot on the head, but I would like to have an 830s.

9792. Re: TS-830S Excessive Grid Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-03 23:45:47 UTC
From: Kevin Hunter
Topic: 9760 Message: 9792

Gordon - I did build the transformer saver.

Here are the voltages...

SG= 252V in LSB TX, 139V in TUNE position on RX, 104V in TUNE position on TX.

FG= -64V in LSB or TUNE Position during TX

DRV= 0.520VAC LSB during TX and .700VAC TUNE during TX

As for actual output. I can't answer that. Since the plate current goes off scale when I key it in CW mode, I've never left it keyed more than about half a second.

ALC appears to be within spec in the TUNE position.

Kevin

Gordon.....

Yes,
That is a reasonable price for a Very Nice 830 with a minor Problem.
Buy it, we'll help you fix it.

I'll take it up with my accounting department, (a/k/a my wife) and see how this all plays out. I appreciate the offer to help.
Dave

I've been using the ceramics for about 20 years and love them. I still have the original set (4 sizes) I bought from KW plus several spares as well as some aftermarket. The only way to hurt them is to drop them. I use a nylon w/metal tip for the trimmer caps.

I should note these are for the coils that use a screwdriver type not hex. The 520 coils are a different animal.

David,
If your accounting Department won't allow you to purchase it, How about telling me where I might ! I always keep a "RADIO" slush fund going... :-)

Thanks,
Gordon

Gordon, I will probably go ahead and get it, but if the deal falls apart I will let you know. Thanks for the reply.

Hmmm,
Very Interesting. I checked the 830 I have here and here is what I read. The SG in receive is 235 in USB and the FG is -92 USB in RX In Transmit Mode I read SG = 220 LSB TX and 110 In Tune RX and 85 in tune Xmit. The FG is -48 in LSB TX and -50 in Tune TX.
Your Voltages appear higher across the Board.
Let me study the schematic some more and get back to you.
Perhaps some of the other Guys on here have some Ideas also. I am puzzled on this. If you back the Carrier control off, can you get the plate current to stop pegging or does the rig appear to take off on its own ?? I am starting to wonder If clif was on to something in the Meter circuit, although you stated that R6 and r10 checked OK.
Does your light bulb (in the Transformer saver) Glow Really bright in Tune Position during transmit ?? R2, R3, R4, and R5 all checked ok for sure ?? All at 20 ohms ? R6 was definately at 2.7 k ? I am not doubting you, just double checking.

Gordon

9798. Re: TS-830S Excessive Grid Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-04 02:05:10 UTC
From: Kevin Hunter
Topic: 9760 Message: 9798

Gordon - I am able to back the CARRIER control down enough to get the plate current under control. I have to turn it way down though. I found that if there is any ALC deflection, the plate current becomes excessive. I backed the ALC down enough to keep the plate current at 250mA. I also had to keep the LOAD cap fully meshed. The output was about 60 watts. At 350mA grid current, the output was 110 watts.

R2 thru R5 are definitely 20 ohms. I had to replace them because the other ones were destroyed. R6 checked 2.719k.

The light bulb does not glow very bright during TX in the TUNE position, but the rig seems to be suffering effects of low voltage. I notice the PLL appears to lose lock if I increase the carrier control very much.

I checked the line fuse and found someone had a 4 amp fuse in there. I was glad to see that. It has never blown, so I feel none of this incient has stressed the transformer very much.

I'm not sure how much it would solve, but I would feel better if I could find whatever it was that I heard arc.

Thanks for your help on this so far. I was off work today, but go back tomorrow, so I'll have to put this project on hold for a couple of days.

Kevin

9799. Re: TS-830S Excessive Grid Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-04 03:47:11 UTC
From: Gordon
Topic: 9760 Message: 9799

Thanks for the info Kevin,
With the Transformer saver in line, I would expect you to experience
the effects of Low Voltage on Transmit because of the resistance in
the light bulb to the circuit. The rig is Not seeing full Voltage
under Load.
If you remove the Transformer saver, do you experience the same effects ?
I am studing the circuit and think we might want to start looking at
the Rf Unit. Have you checked all the Components on the Rectifier
board ?? They are all important to everything eles down the line .
Those parts seem to fail Often !
Gordon

Hello to all..I have a straight key connected to a HEATHKIT Practice Oscillator...forgive me here.....it has two wires..connected to it...what kind of jack would it take to connect to the TS-820S...or can I run a cable from the headphone jack from the oscilator to the rig...thank you for your time..THX DE KE7GGV...

9801. TS-530s NoDisplay or RX

G'day All,

My TS-530s has decided to play Dead. Worked great on Tuesday night but when I turned it on this morning the Dial lights came on the leds work but nada no one was home.

I've tightend all the board screws, cleaned the band switch and pots, checked SG switch, the HV resistors read 5 ohm and 3 ohms. The one thing I find strange was that they were overwound by 4 turns of bare wire (like the Resistor tails) connected at each end I would have assumed that this would have created a dead short bypassing the resistors. Is this normal??

The unit has worked almost flawlessly for the paost 2 1/2 years. once or twice no display or RX for 30 Seconds to 1 min then fine again.

I have replaced the 12BY7A with 2 others same result.

I'm only at a basic level for poject but would like any advise that will help me get it going again.

Regards Bob M. VK4HAY

Guys, I ran across an 830s in VERY NICE condition with new tubes but low output. Priced at $250. Is that reasonable? I need another radio like a knot on the head, but I would like to have an 830s.

I'm cornfused. How are you getting an idle bias of 60 ma and a plate current of 150 ma? The idle bias is cathode current. I don't know if you want to run it on receive much unless you have a light bulb in series with it. Remember, the voltages are still on the tubes. they could be sitting there running bunches of current and you would never know it.

Ok, Great.
We'll diagnose this thing, component by component.. hi hi..

Gordon

I use the center fiberglass rod from the small K-40 CB antennas. Cut them to about 4 inches or whatever and place them in a drill. Then spin the rod against a moving grinder to sharpen them to a pencil point. Then I take them out of the drill and use the grinder to make a blade. When they get flaky, I just re sharpen them.

Perhaps you could find another source of rods. Check the trash cans on fuel islands at truck stops or CB shops. The wire in these usually breaks in about 30 days and they get thrown away.

My alignment tools are all plastic and are getting well worn. Can
someone suggest a place that sells good quality non-conductive tools
for adjusting Coils and Caps ? Anyone tried the Ceramic tools ?
I know better then to try to use metal (The slugs break) and
conductive bites ..

Gordon and Walt M. :

Unfortunately, I don't have any spares. I sent my extras to the Fox Tango group and they got all scarfed up quickly. Steve can come up with a good Schottky diode for you. Steve, the owner of Consolidated is a ham. He also has some 3SK 40s.
This guy is a good source of all kinds of Asian parts. The parts quality is top notch, the prices are cheap, and the service is great. Who could ask for more. Steve is on the DARA board for the Dayton Hanvention.

Rick, Where did you purchase them from? I might just make an order,
then I can sell them back to the guys in small quantities ,as you are
doing. Not for Profit, just for convenience and to help out.

73,
Gordon

Forget the Heathkit oscillator. Connect a piece of coax (RG-58 or 59 stranded center is best You can also use shielded audio cable) from the key to a 1/4 inch mono phone plug. Connect the center to the key terminal that goes to the fixed contact on the key. Connect the shield to the other key terminal that goes to the movable part. On the other end connect the center of the coax to the terminal of the 1/4 inch mono phone plug that goes to the tip. Connect the shield to the part that goes to the outside of the plug.

When in CW on receive you will hear the sidetone of the 820 and can practice code. When CW transmit, it will send CW.

Bob,

From your description of the "HV resistors" it sounds like your are describing the parasitic suppressors connected to the final plate caps and plate choke in the top of the final compartment. Am I correct? If so, they should be a dead short at DC using an ohm meter. While you are there be sure to check the soldered connections as they may need attention.

The resistors to measure are in the cathode circuit of the finals under the final compartment in the bottom of the chassis. Those are each 20 ohms and are in parallel. They should measure 5 ohms.

As for the "no one was home" condition, it sounds like the 12 VDC regulator on the AF unit X49-1150-00 (board) is the problem. If you have the road map (schematic) check the regulated output at connection 12 and the regulator input at connection 14 on the edges of the board. What do you find?

Bob,

I experienced a similar problem with my 830 recently - no receive and no display, and only the pilot lights worked. All voltages on the Rectifier Board were normal. It turned out to be a pass transistor in the 9V regulator circuit on the AF Board. On your TS-530, use a DVM to check from TP6 on the AF Board to circuit board common and see if you have 9 volts. If not, you probably won't have the 3.2 volts on Pin 5 of Connector 11 either. I have heard that similar symptoms can be caused by poor ground connections between the AF Board and the main metal chassis where the screws secure the board.

Ken could be correct also, because if there is no voltage coming into connection point 14A on the AF Board, you will not have any 9 volt power either. There should be about 19V at connection point 14A when measured with your DVM to circuit board common.

Good Hunting Bob.

G'day All,

My TS-530s has decided to play Dead. Worked great on Tuesday night
but when I turned it on this morning the Dial lights came on the
leds work but nada no one was home.

I've tightend all the board screws, cleaned the band switch and pots,
checked SG switch, the HV resistors read 5 ohm and 3 ohms. The one
thing I find strange was that they were overwound by 4 turns of bare
wire (like the Resistor tails) connected at each end I would have
assumed that this would have created a dead short bypassing the
resistors. Is this normal??

The unit has worked almost flawlessly for the paost 2 1/2 years.
once or twice no display or RX for 30 Seconds to 1 min then fine
again.

I have replaced the 12BY7A with 2 others same result.

I'm only at a basic level for poject but would like any advise that
will help me get it going again.

Amen Dave,

There are several of us waiting to see what you do about the 830, but I think Gordon spoke up first. This is one of the most interesting "groups" I have experienced. We're all encouraging each other to get deeper in debt buying and fixing these great Kenwood radios. But, it's fun.

I think that the resistors you are referring to are the ones that go to the plate caps. these are parasitic chokes. The wire around them rejects VHF parasitic and the resister part serves as a reject load and turns the parasitic energy to heat. Does the read out work?

I soon will be swapping the modulator and detector diodes but I have seen reference to a 100 ohm resistor. Can anyone tell me what this refers to?

Thanks Walt - this is a wonderful common sense guide to good audio
with the TS-520/S/SE family. Thanks you very much for the time and
effort putting this together. I will be referring to it often.

I should have read in the subject line that the display did not work. Is the dummy plug securely in the VFO socket on the back ?

I think that the resistors you are referring to are the ones that go to the plate caps. these are parasitic chokes. The wire around them rejects VHF parasitic and the resister part serves as a reject load and turns the parasitic energy to heat. Does the read out work?

Subject: [TS-520_820_530_830] TS-530s NoDisplay or RX

G'day All,

My TS-530s has decided to play Dead. Worked great on Tuesday night but when I turned it on this morning the Dial lights came on the leds work but nada no one was home.

I've tightend all the board screws, cleaned the band switch and pots, checked SG switch, the HV resistors read 5 ohm and 3 ohms. The one thing I find strange was that they were overwound by 4 turns of bare wire (like the Resistor tails) connected at each end I would have assumed that this would have created a dead short bypassing the resistors. Is this normal??

The unit has worked almost flawlessly for the paost 2 1/2 years. once or twice no display or RX for 30 Seconds to 1 min then fine again.

I have replaced the 12BY7A with 2 others same result.

I'm only at a basic level for poject but would like any advise that will help me get it going again.

Regards Bob M. VK4HAY

Subject: Re: [TS-520_820_530_830] Re: TS-830S Product Detector Mod

Hi Gordon,

When I ordered them, I stipulated to the guy on the phone I wanted 1% tolerance if he had them. I had wanted 1N6263 diodes as listed in AG6K's article, but he told me the 1N5711's were very good...and had a higher voltage rating. He was right ...The junction resistance and capacitance differences are nill. I used a B&K 810C and a Fluke 77 which are supposed to be accurate to .5% (that is 'point' 5%) so the diodes are matched close enough for our use. The only problem ordering them is dealing with the minimum order most electronic sellers have. You probably won't need 25 or 50 of them.

73' Rick KC0HH

Gordon <n6wk@... <mailto:n6wk%40n6wk.com> > wrote: Thanks Rick,
I also appreciate you selling me the Diodes.
Walt was wondering if they were matched. I didn't check them, I just installed them and checked the Carrier adjustment. I had to tweak L19 and L20 just a bit but the Carrier balance was still right on. I am now debating whether to go ahead and swap out the Balanced Modulator diodes as well.

Were the Diodes matched ? They sure do work nice in the 830.

Thanks again,
Gordon
N6WK

since I did the Shottkey mod on my 830S....The noise floor is
definitely better and the 830S' white noise level doesn't give me a
headache while listening with headphones now. I think after you make
the diode swap, the lack of phase noise in the 830S' receiver lets you
hear more signals.....The Shottkey diodes are a cheap fix.

Allied Electronics...I got them about a year ago and now I see they are about $1 each. These were made by Vishay...I don't know if all the semi-conductor manufacturers hold as close tolerance as Vishay or if it is just a German thing but these were great..Almost perfect uniformity.
I also see some Vishay made 5711 lots on E-Bay from a guy in Placentia,Ca. . I have bought some things from him...They would only be about 13 cents each this way.
I had originally wanted the HP Shottkey diodes Rich Measures talks about in his article but they were almost $5 each. A little stiff for 8 of them plus shipping.

Rick KC0HH

Gordon <n6wk@...> wrote:
Rick, Where did you purchase them from? I might just make an order,
then I can sell them back to the guys in small quantities ,as you are
doing. Not for Profit, just for convenience and to help out.

Gordon - No low voltage type problems when the xformer saver is not in line. I will begin checking the components on that rectifier board. I have not done that so far. Thanks for the guidance. I'll keep you posted.

Kevin

Group-
I've come onto a working 820S (haven't spruced it up yet, but getting ready), and would like to find/install the digital read-out. Anyone have one that you would be willing to part with? Thanks.

73,
Max, K5OVW

9818. Re: [TS-520_820_530_830] Swapping diodes ?? (Terminating Resistor)

Yahoo group: TS-520_820_530_830 (2006)

From: Rick May
Topic: 9811 Message: 9818

Hi Max,
Rich Measures refers to it in his article. Look at number 11 http://www.somis.org/830.html where he refers to the lack of a terminating resistor adding to distortion.

Hi Gordon,

The web site for Allied Electronics is http://www.alliedelec.com/

Hi Gordon,

In checking Allied, they show $1.51 each for a 1N5711 (part number 787-9990) but if you search on 1N5711-TR (part number 950-1588) they show a Vishay 1N5711 Shottkey for 10 cents each with no minimum order amount. I don't know what tolerance they would be . Maybe the 1% tolereance I wanted are that much more expensive. Makes sense. but for a dime each, order 16 and you should be able to match groups of 4....

Gordon, Max and Julio: thanks. I will try some RTTY into my dummy
first, see how it works. Hope to meet some members of this group on
the air. Stay tuned October 21-22.

Hi Group.

Mouser has several different kinds of 1N5711 diodes for only a few cents each with no minimum order. You can go to www.mouser.com and search their catalog, or go there and get their 800 number and call them for help. Shipping will be the biggest cost, so you might want to order other items you need at the same time. As I recall they have the Vishay if that is what you want. Disclaimer - no connection with them - that's just where I found mine.

Hi Gordon,

In checking Allied, they show $1.51 each for a 1N5711 (part number 787-9990) but if you search on 1N5711-TR (part number 950-1588) they show a Vishay 1N5711 Shottkey for 10 cents each with no minimum order amount. I don't know what tolerance they would be . Maybe the 1% tolereance I wanted are that much more expensive. Makes sense. but for a dime each, order 16 and you should be able to match groups of 4....

Walt, Gordon, and others...

A divorce may be in my future, but I ordered the TS830s that had low output. I got it from Memphis Amateur in Memphis. I have dealt with Marshall for years, so I trust he judgment. He said the usual resistors needed be replaced, but they didn't have a tech any longer to do it, so its mine. He states the radio looks like new, and they traded for it on the mans word that it was a-ok. Finals were blown. Been too hot. Voltages all ok, but the output low.

It should arrive Friday UPS, if I'm not heard from again, send flowers....

(Just kidding, after 40+ years of this, she's not surprised by anything that shows up)

Now don't forget I'm going to be waving the white flag next week.

I am going to the Belton Swapmeet this weekend to sell some radio equipment, and just thought I would put the info out to this group in case one of you might be interested. Some of you have helped me refurbish these Kenwoods over the last year, which is appreciated, and now I need to make space for some more retirement projects. Please contact me by direct email k5gcw@... if you have any interest in the following items, and we can exchange detail information: Kenwood TS-820S with VFO-820 and SP-820, Kenwood TS-530S, and Kenwood TS-830S. Other items: Icom 751A, Icom IC-2KL, and Eimac 3-500Z (new pair). Ship to lower 48 states only. Thanks.

Forget the Heathkit oscillator. Connect a piece of coax (RG-58 or 59
stranded center is best You can also use shielded audio cable) from the
key to a 1/4 inch mono phone plug. Connect the center to the key
terminal that goes to the fixed contact on the key. Connect the shield
to the other key terminal that goes to the movable part. On the other
end connect the center of the coax to the terminal of the 1/4 inch mono
phone plug that goes to the tip. Connect the shield to the part that
goes to the outside of the plug.

When in CW on receive you will hear the sidetone of the 820 and can
practice code. When CW transmit, it will send CW.

Hi Rick,
I just bought 100pcs VISHAY 1N5711 15mA 70 Volt Schottky Rectifiers for $9.50 plus shipping. When I get them, I will put them in matched sets of 4 or 8. Then, I will be happy to sell them out to anyone who needs them.
Thanks for the info on where to get them.
73,
Gordon

From: Ruben Echevarria
Topic: 9775 Message: 9829

I picked up a TS830S with the SP230 speaker, PC1 patch, MC50 mic for $366.00 through EBay.
The MC50 had no coiled mic cable but N5EBD helped me out with that.
The radio is now in use after a good clean up. The rest of the pieces are good to execellent.
So I'd say $250.00 for a working but low output TS830S is excellent. Go for it !!

Topic: 9760 Message: 9830

Since I haven't seen this mentioned: Is there a dummy load on the output; if there is, and you disconnect the cable from the back of the rig going to the dummy load, does the plate current change (Note: rig in transmit mode should only be on for a very brief moment), The point of all this is to make sure the output of the pi-network is terminated. You also want to make sure, if there is a cable between the rig output and the dummy load, it's neither shorted nor open. That would cause excessive plate current to flow, crazy readings, burnt out resistors, etc. I know this is "old school" but, since the 830 has a pi-network on the output, hanging a 75 or 100 watt bulb on the output can sometimes provide you a relative indicator of power output if any.

Also, I also didn't see this, what band are you doing this tests on and/or, have you tried doing these tests on any other band??

HI Gordon,

That will work....Good price... I paid 35 cents apiece for the ones I bought last year and thought that was cheap. 100 of them will do quite a few radios. When I first powered my 830S up after swapping the diodes, I thought I had failed to re-connect something inside. The receiver was so much quieter. It really is a worthwile mod.

Walt - The 130mA figure is taken in TX mode in the tune position. The
60mA figure is taken in TX mode in the LSB position with the mic gain
all the way down. The 150mA figure was the idle bias after I started
having problems with the rig and before I adjusted it back down to
60mA. Does this info help?

Kevin

From: w5rkl
Topic: 9760 Message: 9833

If you remove the 12BY7 driver tube what plate current reading do you get in TX? Doing this will remove any/all (hopefully) input drive to the final stage.

This arcing problem sounds so much like what happened to my 820. The difference is your receive section still works (I'm assuming it does), mine doesn't.

My 820 was simply sitting on the desk, in receive mode, and within a minute of powering it on, zzzzziitttt and the smell of burnt resistor and the 820 shut down, nothing lit not even the pilot lamps. It was as though the power plug was pulled from the wall.

I pulled the cover off the bottom and the 10 ohm resistors consisting of two 20 ohm 1/2 watt resistors in parallel, each resistor was cracked from one end of the resistor to the other. I replaced the resistors with single 10 ohm 1/2 watt resistors and everything powered up fine, no arcing nothing. The receive sensitivity was down by 20 db with the calibrator. Keyed the 820 into a dummy load, good power out and normal plate current. Unkeyed and receive was history, nothing, and no audio. The lamps, heaters, meter and front panel LEDs all work fine. The remote VFO has not been plugged in but pins 8 and 9 were shorted on the rear 9 pin socket otherwise the internal VFO wouldn't work.

For what ever reason, the arcing took out something in the receiver section. The VCO, VFO, PLL and hetrodyne oscillators are all working properly, checked them all with a scope, frequency counter and by also listening on a seperate receiver. If one or more were not working the transmitter wouldn't work since they are used in both receive and transmit. However, absolutely no receive. The audio amp works fine as I can hear the transmit audio through the internal/external speaker with the "MON" switch turned "ON".

I would be interested to see the outcome of this problem as it may help me find my 820 receive problem.

73's,

Mike

Thanks Rick,
I agree about the fix. This Radio hears REALLY great now after the fix and alignment.
If you ever need any diodes, just drop me a note.
I should have them in 2 days as the seller is close and already notified me they will ship tomorrow.
73,
Gordon

Mike,
Have you checked Q2 on the RF unit ? Do you get any S meter movement?

I'm bringing this post back to the front of the group. I should receive my new crystals today. Does anyone have any best practices solutions for getting the board out, replacing the crystals or retuning the oscillator?

Thanks,
K7MEI Brent

I called a buddy listing a TS830 with digital VFO here in Ontario. I am taking the VFO but he still has the 830 for sale. He would like to get $425 CDN (about $375 US) for it. He says it is in excellent condition. I would think shipping would be on top of that from Otario. I would take it, but I don't think I could sneak it into the house!

Contact me off board if interested.

Max VE3TMT

Max, I know it is good for the 820, so I can only assume it is good for the 530 also.

The Diodes are only going to be 11 cents each plus shipping, But I need to receive them and Match them before sending them out.

Well, long ago when I was in school. We used a special curve tracing oscilloscope that would display the diode/transistor performance characteristics. In your case, there should be a technical data sheet available for the devices you have recently purchased at the manufacture's and/or distributor's web sites. (Implication here is that if the manufacture states that the whole batch is within 0.0001 % or better then the whole batch is pretty much already matched. IMHO) Here is an interesting web page for your consideration:

I had the same question and did a little web searching. I found this text at http://pavouk.org/hw/leachamp/en_index.html:

Zener Diode Matching

The zener voltage of a diode can easily be measured by connecting a resistor in series with it on an electronic breadboard and connecting a bench power supply across the series combination. The power supply voltage should be set so that the current through the diode is 3.3 mA. If you don't have a current meter, the voltage across the resistor should measure 3.3 x R, where R is in kohms. For example, the voltage across a 2 kohm should be 6.6 V. Once the current is set, the dc voltage across the zener diode can be measured with a voltmeter. For example, if you have +15 V and -15 V supplies, connect the diode in series with a 3 kohm resistor across the two outputs and measure the diode voltage. If you get the diode backward, the resistor will get hot.

While this is for zener diodes, I imagine the same approach could be used for the Schottky, but you'd be measuring much lower forward voltages (and using lower source voltages).

Gordon,

When you get your shipment of diodes in. I would like to order 8 of them from you. I am good in the callbook and on QRZ. I can also pay by paypal or any other means.

Thanks,
Walt, KA2NJF

Thanks Rick,
I agree about the fix. This Radio hears REALLY great now after the fix and alignment.
If you ever need any diodes, just drop me a note.
I should have them in 2 days as the seller is close and already notified me they will ship tomorrow.
73,
Gordon

You can always try Dan on Ebay - dpi4parts. He always has quantities
of 25, 50 & 100 listed.
Just a happy customer.

Gordon
How does one go about matching these.
thanks
Barry

Ed, The Only Dumb Question, is the one that was never asked.
I have a meter here that has a Diode function on it. What I do is measure each Diode and match those that come up with the same reading. For example, I have 4 Shottky Diodes here. I check them and 2 have a reading of 469, one reads 470 and the last reads 474. So, I would match the two 469's as a matched pair. I will do that with all 100 I receive and ship them accordingly. I'm sure they will be matched close enough for what we are doing.
I am sure there are more sophisticated ways, but this one works for me. The results after installation appear Fine !
After all, These Diodes are probably all within 5% of each other any way. I am doing the Best I can to match them.
73,

Gordon

Barry,
I have a Diode Checker on my DVM Meter here. I match according to
the reading when I test them. So Far, I have had NO problem doing it
this way. I seperate them according to the Meter reading outcome and
place them in similar groups.
73,
Gordon

Topic: 9852 Message: 9852

Hello Gordon, I've been following the thread on the diode mod. Lots of good information. As for me and my 830 ...
I'm still looking for the reason why I can't get my ALC to work properly.
The radio is receiving normally. After doing some work on the IF board, basically resoldered
all the points on the board. Check voltages as Walt asked me to do. Pulled the RF board checked all the resistor values (all within specs). Replaced components as per VK5KYO posting. Radio loads to about 85 watts on 40 meters, but can't get enough swing on ALC also seems like not enough audio to drive the final. I've changed finals and drivers. Still the same thing. I'm wondering if I'm getting enough voltage to the driver circuit. HELP!!

Solder-wick and a long skinny tip on the soldering iron. I've never
had to remove the board (major PITA) for a xtal swap.

Pete and Mike - Thanks for your suggestions. I am eager to try them.
My schedule is a bit full the next few days. I will reply when I have
an opportunity to do more work. I also intend to check the components
on the rectifier board.

I have to admit, I've not even given a thought about the receiver.

Just a quick Reply Thanks for all the Help I will need to check it out on the weekend as today and Friday I donate my time to fixing old computers for a charity so they can make. A few bucks and sell them off. Unfortunately it get a bit frustrating since my strokes in 2002 I forget what I'm doing or where I put something it takes time but that is what I have and it's free.

Yes it was the Cap resistors I was talking about sorry if I got them mixed up this unit is darn near original so I thought I might look over some of the trouble spots while I was inside. I have done a yearly clean and tighten since I got it.

Walt I have now VFO jumper and I'll check the book but I do not remember hearing of the 530s needing one but I can be wrong. I have had a quick look and do not see and pins jumpered from the inside. If so what pins looking from the rear of the cabinet at the socket and I'll double check with ohm meter.

This might take a little bit of time and I know that you are all patient when it come to repairs and being down under in the wonderful Home of Bundaberg Rum (a drink I'm not partial too)Adds a little more time between posts.

Thanks everyone as I proceed through the posts and check each suggestion I'll post a reply to what I Find
Regards Bob M. Vk4HAY

1N5711 Shottkey diodes

This place has 1N5711 Shottkey diodes. That is where I got mine. Yesterday when I posted this I could not remember what the number on the diodes was. I got them out and they are 1N5711.
They also have some 3SK40 FETs

Steve, the owner of Consolidated is a ham. He is on the DARA board for the Dayton Hanvention.

This is a good source of all kinds of Asian parts including capacitors and resistors. The parts quality is top notch, the prices are cheap, and the service is great. Who could ask for more.

Do not run more than 25 watts or so. RTTY is very high duty cycle and you can fry the finals and transformer quickly.

Gordon, Max and Julio: thanks. I will try some RTTY into my dummy first, see how it works. Hope to meet some members of this group on the air. Stay tuned October 21-22.

Hi Gordon,

In checking Allied, they show $1.51 each for a 1N5711 (part number 787-9990) but if you search on 1N5711-TR (part number 950-1588) they show a Vishay 1N5711 Shottkey for 10 cents each with no minimum order amount. I don't know what tolerance they would be . Maybe the 1% tolereance I wanted are that much more expensive. Makes sense. but for a dime each, order 16 and you should be able to match groups of 4....

Rick KC0HH

Gordon <n6wk@...> wrote:
Rick, Where did you purchase them from? I might just make an order,
then I can sell them back to the guys in small quantities ,as you are
doing. Not for Profit, just for convenience and to help out.

73,
Gordon

in regards to nothing on the 520, i can only say on my 820 it was the low voltage power supply diodes that went south, replaced all 4 and walla low voltage back and operation normal, not sure if the same on 520. ron ne0x

Kevin:
Just to humor me, please turn the rig off. Let it discharge. With your ohm meter measure the resistance from pin 1 on either final tube socket to ground. Pin 1 is where the 20 ohm resistors go. Do not remove the tubes or resistors when doing this. Please let me know what the resistance it.

Gordon - No low voltage type problems when the xformer saver is not in line. I will begin checking the components on that rectifier board. I have not done that so far. Thanks for the guidance. I'll keep you posted.

Kevin

Ruben:
Looks like you are getting things narrowed down.

Check the soldering on the tube socket pins for the 12BY7. Then with the SG switch off, the rig in SSB transmit and the mike gain fully down, measure the voltages on the 12BY7 on pins:
1. Cathode
2. Control Grid, may be a - voltage
3. Suppressor grid should be 0 ground
7. Plate
8 Screen Grid.

Hello Gordon, I've been following the thread on the diode mod. Lots of good information.
As for me and my 830 ...
I'm still looking for the reason why I can't get my ALC to work properly.
The radio is receiving normally. After doing some work on the IF board, basically resoldered
all the points on the board. Check voltages as Walt asked me to do. Pulled the RF board checked all the resistor values (all within specs). Replaced components as per VK5KYO posting. Radio loads to about 85 watts on 40 meters, but can't get enough swing on ALC also seems like not enough audio to drive the final. I've changed finals and drivers. Still the same thing. I'm wondering if I'm getting enough voltage to the driver circuit. HELP!!

OK here goes I'll reply in one email to Bill,Ken and Walt and any
others that may be watching.

Results so Far.

TPG -- 12 = +12.06v
TPG -- TP6 = + 9.01v
14G -- 14A = +17.95v

Not sure wich way pins are numbered
Connector 11 from 14A end

GND -- Brown = + 2.07v
GND -- Blue = + 1.63v
GND -- Red = + 9.02v
GND -- Green = + 9.01v
GND -- Orange= + 3.58v

The Resistors on Final Board
without removing PCB on foil side.

R2 = 5.4 Ohm
R3 = 5.5 Ohm
R4 = 5.4 Ohm
R5 = 5.4 Ohm

Resistors still in place on PCB

do I need to remove the 6164B's
and flip Final PCB out to test better.

Thanks Bob M VK4HAY

that go to the plate caps. these are parasitic chokes. The wire
around them rejects VHF parasitic and the resister part serves as a
reject load and turns the parasitic energy to heat. Does the read
out work?

Hi Rick.

You and Gordon are discussing a very interesting topic. I want to take some of my 1N5711's and do some comparison testing with you both. Did you use an RLC Bridge to measure the capacitance and resistance? or, how did you do it? I think my Fluke 8060A can also measure diodes like what Gordon is doing. When you get down to measuring capacitances like 2pf, the leads on your meter can mess you up unless you subtract that out of your reading (however, for comparisons only, it probably makes no difference). Although we may not need to be concerned about close matching in our application, it would be nice to know a convenient and relatively accurate way of matching diodes when needed.

A couple of years ago I used my RLC Bridge to compare interelectrode capacitances in some vacuum tubes. I never did get my readings to match the tube manual data, but I sure could get different readings in my comparisons between tubes - and the readings were repeatable. I don't have a really good tube checker, so could not check to see if my bridge capacitance readings were valid indications of tube differences or not. Interesting stuff.

Hi Bill,

I sent a reply to Gordon answering his question on how I tested the diodes but the e-mail response went off in the ether somewhere.
You match the diodes by comparing junction capacitance and junction resistance. I used a B&K 810C to check the capacitance.. There is a zero function to remove the value of the capacitance of the test leads. All 25 of the 5711 diodes I checked were 2 pF and I used my Fluke 77 to measure resistance which was 126.90 K. There was no difference I could see between any of the diodes. Gordon is checking 4 (5711's) of the 25 I had. If Gordon's diode tester with values of 469,470 and 474 are any indication, I probably would not see 1% variations in diodes using the test gear I had. I would say any 4 of the 25 diodes I had on hand could be considered matched close enough for our use.

Although we may not need to be concerned about close matching in our application, it would be nice to know a convenient and relatively accurate way of matching diodes when needed.

A couple of years ago I used my RLC Bridge to compare interelectrode capacitances in some vacuum tubes. I never did get my readings to match the tube manual data, but I sure could get different readings in my comparisons between tubes - and the readings were repeatable. I don't have a really good tube checker, so could not check to see if my bridge capacitance readings were valid indications of tube differences or not. Interesting stuff.

Hi Gordon,

Do you know what the number signifies using the diode checker? The mean of the four diodes is 470.5 which indicates they are all well within 1% tolerance from each other. When I measured them for junction capacitance and junction resistance I came up with 2 pF and 126.9K

Rick KC0HH

Gordon <n6wk@...> wrote:
Ed, The Only Dumb Question, is the one that was never asked.
I have a meter here that has a Diode function on it. What I do is measure each Diode and match those that come up with the same reading. For example, I have 4 Shottky Diodes here. I check them and 2 have a reading of 469, one reads 470 and the last reads 474. So, I would match the two 469's as a matched pair. I will do that with all 100 I receive and ship them accordingly. I'm sure they will be matched close enough for what we are doing.
I am sure there are more sophisticated ways, but this one works for me. The results after installation appear Fine !
After all, These Diodes are probably all within 5% of each other any way. I am doing the Best I can to match them.
73,

Gordon

Hi Bill,

I had one of those 'duh' moments.. Gordon e-mailed me direct with his question about how I tested the diodes. My reply went directly to him and not the group. I went back and replied again ...Of course the reply went to him again. After I looked at the 'FROM' header on his e-mail, I realized why they were not showing up here on the group.....

Hi Rick.

You and Gordon are discussing a very interesting topic. I want to take some of my 1N5711's and do some comparison testing with you both. Did you use an RLC Bridge to measure the capacitance and resistance? or, how did you do it?

Walt,
I will match them as best I can with my diode tester. The tolerence
is probably close enough anyway without testing them. So far, The
ones I have tested are very close to one another. I contacted Vishey
for a manufacture Tolerence Sheet on the ones I just purchased.

787-9990) but if you search on 1N5711-TR (part number 950-1588) they
show a Vishay 1N5711 Shottkey for 10 cents each with no minimum order
amount. I don't know what tolerance they would be . Maybe the 1%
tolereance I wanted are that much more expensive. Makes sense. but for
a dime each, order 16 and you should be able to match groups of 4....

Hi Rick,
No , I do NOT know what the number represents. I long ago misplaced
the manual for this meter. I just use the number as a reference
against other Diodes for matching.
I have had good luck doing it this way and had No problems yet.

Gordon

Hi Walt
I have you down for 8 Diodes.

I'll contact you with a total cost in a day or so. It will be 11 cents
each plus whatever the shipping comes out to. Not much I'm sure.
No other Costs involved.
73,
Gordon

Hi Bob,
Yes, go to this site. It is Item # 11 that we are doing for the
Product detector Mod.
Item # 13 is the Balanced Modulator Mod .
Item # 3 is to swap out a Capacitor and open up the Audio a bit.

Bob, I did some Dealing and ended up with a Tektronix 2235 Scope. It is Dual Trace and good to 100 Mhz. It works great for repairing these hybrids.
You'll need a 10X probe with it. A 1X is easy to make up.
I see these scopes on Ebay for a couple hundred bucks or so.
In Fact, there is a nice one there now for Buy it now of $ 199 dollars.

Hi,

I'm looking for a used oscilloscope for use in the repair of the Kenwood TS series Hybrid transceivers. Any suggestions on a used oscilloscope for beginners? I do not want a full blown service scope. Any suggestions of brand and model number.

I have said it before, Thanks to all on this group that help keep the Kenwood TS Hybrid Transceivers on the air!

Thank You,
Bob Ferrey Jr. N3DOK

Jim, on the MC-50 mic I have, you can plug the connector in two ways. One is a lower impedance by one color dot and one is a high impedance by a different color dot. go to the high impedance one. I forget the color dot it is.

Chris,

Using the MC-50 with my TS-830 requires that the mic gain be turned full clockwise. It appears to work just fine, though. If that's what you're seeing, you don't have to change mics.

73,
Jim K4AXF

Subject: [TS-520_820_530_830] Best mic for 830s?

Hello, I just picked up a Kenwood 830s this last weekend. The mc-50
was bad will not drive the radio. I have a D104 that works, but I
understand I may have impedance matching problem. Looking on Heil web
site I see they have a kit for the D104.Or is it just better to get a
new mic?

I do like my D104 it looks cool.

Well, my VFO is on the way, leaves only the SM-220 to complete the station. As I posted before, the seller of the VFO has an 830 for sale in great condition. He would probably take $400 CDN, about $375 US.

Hi All,
Because of the great response I received about the Schottky Diodes,
I ordered another 100 of them. This way I will be able to match
everyones diode order very closely. I want you all to get diodes that
are matched as close as I can get them.
So, I will be able to fill everyones order.
At 11 cents each, I don't think anyone can go wrong.
Thanks Guys.
All orders should ship by Saturday.

Hi Ruben,
I received your message on my machine. Sorry I missed yo.
I wish I had more info to give you on your lack of ALC. I , as Walt
has menbtioned, am also uspect of the terminals on the 12by7 socket.
I wish I had more info to just throw out there for you, but you have
a difficult one going on. I am sure we will get to the bottom of it
sooner or later. When in tune, do you get lots of ALC reading ?
If so, what Mike are you using with that rig? 80 watts does seem a
bit low for new Finals and a new driver.. Of course, if your line
Voltage is low it can affect everything. My Line Voltage here is 122
Volts

Gordon

Is this also called VR-3 ?
I think this is the trimmer called VR-3. If so, it adjusts the CW transmit frequency offset so that when a CW station tunes you in, he hears a 700 Hz tone instead of a zero beat. If you have a very accurate frequency counter, it can be used to set the carrier oscillator to 8830.7 kHz when in the CW transmit mode. If you do not have a frequency counter, it is best not to change this. If you do, mark the initial position of the control with a felt tip marker so you can get it back if you have difficulty.

Bob:
I told you something incorrect in an earlier message. There is no jumper plug required for the VFO socket in the TS-830. There is one required for the 520 and 820. In the 830, a internal switch in the DIN socket does this.

If the display is dead and the rig has no receive, the problem is not on the final board.

There is a row of 3 push button switches to the left of the VFO knob between it and the mike gain. The top one is laveled Fix. Be sure that it is NOT pushed in.

Please tell me, do you get receive ? Do you hear anything from the speaker hiss, hum ? If you push the RF ATT on, does the RF ATT light above the display light ? I am not suspecting the RF Attenuater itself, but this tells me something. Does your s meter do anything ?

OK here goes I'll reply in one email to Bill,Ken and Walt and any others that may be watching.

Results so Far.

TPG -- 12 = +12.06v
TPG -- TP6 = + 9.01v
14G -- 14A = +17.95v

Not sure wich way pins are numbered
Connector 11 from 14A end

GND -- Brown = + 2.07v
GND -- Blue = + 1.63v
GND -- Red = + 9.02v
GND -- Green = + 9.01v
GND -- Orange= + 3.58v

The Resistors on Final Board
without removing PCB on foil side.

R2 = 5.4 Ohm
R3 = 5.5 Ohm

R4 = 5.4 Ohm
R5 = 5.4 Ohm

Resistors still in place on PCB

do I need to remove the 6164B's
and flip Final PCB out to test better.

Thanks Bob M VK4HAY

Bob:

I really must be following too many of these repair projects at once. Let me try this again, this time for the TS-530.

Bob:
I told you something incorrect in an earlier message. There is no jumper plug required for the VFO socket in the TS-530. There is one required for the 520 and 820. In the 830, a internal switch in the DIN socket does this.

Remove any plugs from the VFO socket or the accessory socket.

If the display is dead and the rig has no receive, the problem is not on the final PA board.

You have no fix switch on the 530 so disregard that in my last message.

Please tell me, do you get receive ? Do you hear anything from the speaker hiss, hum ?

If you push the RF ATT on, does the RF ATT light above the display light ? I am not suspecting the RF Attenuator itself, but this tells me something. Does your s meter do anything ?

This is the CW offset adjustment. I learned the hard way. While adjusting the xtal oscillator trimmers I put the screwdriver in this hole by mistake. I don't do much CW so I'm not worried about it. If I ever get a freq counter in the shack I'll fix it then. Just below that pot, VR2, is the SSB carrier point adjustment. If you want to add more lows to your SSB signal this is the one. Only trouble is it has the opposite effect on the opposite sideband. So you have to adjust it so you sound the same on both sidebands. I have rewired mine to the front panel TONE control so I can adjust it on the fly. On one end it brings in some nice lows for ragchewing or you can set it on the high side for busting through the pileups. Most of the time I don't touch it.

If you accidentally turn it, get with somebody on CW. Have him tune to you. nudge the pot one way or the other so when he tunes to you, you hear him with a tone of about 700 Hz. He will have to retune each time you nudge the pot.

Walt, Do not worry about it I understood what you were on about.

OK I kept cleaning the earths screws and the Ground Springs on the band switch. Cleaned the Brown jumper wire on the push on pins at the Filters also I the push on Black cable on the PLL Board I think it's the VCO cable. I went back and tested the Radio.

So now it is all running OK again, Just had a 2 hour QSO down to brisbane about 400 miles away Great Reports both ways.

Thanks for the suggestions and help. I'd still be interested in info to check on general servicing. I'd like to try and get a 830s.

I do not write much but I read every daily digest from this group.

Take care and maybe one day I can help someone. I do tell other Australian Kenwood users of the Group if that are having problems.

Keep up the good work

73

Hmmmmm, all of the talk about this mod for the TS-830S, makes me w9onder if it wouldn't be a good mod for the 820 series. Any ideas on the issue?

Hi Ellen and all,

I'm about to start the Inrad mods to replace the original noisy dual-gate mosfets (Q2, 3, 6 &7) on
the RF board.
All this talk of reducing noise by replacing diodes makes me wonder if I'm barking up the wrong
tree...

Maybe both mods should be done?

I bought a Hitachi V1100A, on Ebay for $130, that I like real well. It is 100Mhz, 4 channel, with digital readouts. I also have a Tektronix 465M which is laying in pieces waiting for Tek proprietary unobtainium parts. The older Teks are good scopes but parts are hard to come by. The main source is in Canada and the shipping costs are scarey. ($20 total for 4 diodes, and they were pulls) Buying a scope on Ebay is a pig in a poke but sometimes you get lucky. It's best to buy one you can see and feel but I live in a small town and didn't have that option.

I've been looking for a scope as well, and will be going to a hamfest at Belton, TX, tomorrow. In the past, such equipment has been powered up, and one can twiddle the knobs/switches, but that's pretty meaningless without some benchmarks or other means of comparison. Any guidance as to what to look for will be greatly appreciated. Thanks, group.

Brent,

Go to the BAMA site and see if they have a manual for it. Then you can read it and see what the specs are.

Heathkit model number scopes generally started with IO(kit version) or SO(wired version). They did make a monitor scope, HO-10, and a panadapter scope, HO-13. Neither are good for trouble shooting.

My 530s has done this on occasion, however, it has always been in the off/on switch. It happened again this morning, same symptoms you describe. I think I will just pull the plug from now on and leave the switch in the on position.

Try working your switch rapidly several times. Thats what I have done and it has always eventually turned it all on.

Thanks Pete. You're right it is an IO-10. I'm sitting at my office and can't see the scope, it's 40 miles away. At least it's not an ID-10-T.

The rule of thumb, for the most accurate readings on
an oscilloscope, is twice the bandwidth of interest so
for hf a 60Mhz scope would be the minumum desired.
That's not to say a lower bandwidth wouldn't be
useful. For some really good information on the basic
use of scopes download Paul Harden's "The Handyman's
Guide to Oscilloscopes parts 1 and 2," at
www.nrao.edu/~pharden/hobby/Scope2.pdf and
www.nrao.edu/~pharden/hobby/Scope1.pdf

Try to buy one with probes and a manual. Some manuals
are available on the Internet, you will need both the
operators and service manuals (if they are separate).
Probes are available on Ebay with the cheaper ones at
$25 for a set of 2, and $50 and up for the better
ones.

The 830s arrived via UPS just a while ago. The radio is very clean as stated, everything seems to work on the receiver as it should, with the exception of the bandswitch. Not a hard fix, not real bad, but I know detect from moving it a little in each position there is some up and down signal strength, etc. So thats got to have attention, as well as a good spray cleaning.

I havent' opened the tube compartment to see what kind of tubes are in it just yet. I have read the chinese tubes are not the best to start with, so I am anxious to see what is in there. I'll get into that this evening perhaps, keep you guys informed, I'm sure I'll need some help to get the transmit up and going.

Thanks David,

I'm sure you could fix it by applying some cleaner and then working the switch a number of times that is unless it's a mechanical problem.

They are not easy to get at beside the base plate. I dislike just pluging in for on/off if you dont get a good puch in the contact can be intermitent and can produce surge like events in the radio.

Regards Bob M

Ellen,
Since the circuits are very similar, I can see NO reason why it
wouldn't work as well on the 820 as it does on the 830.
I have to tell you, I was Really impressed with the results of doing
the Product detector Mod. The 830 now hears stuff that my TS-2000 can
not. The TS-2000 can hear someone in the noise when they are really
weak, but the 830 can hear WHO it is in the noise when really weak.
I am impressed.
73,
Gordon

WHO it is in the noise when really weak.

I am impressed.
73,
Gordon

Geesh Gordon, I'm anxious enough waiting for my diodes to arrive!
I will be changing the modulator diodes as well. I also have a VFO-230
coming to the shack next week as well. Will feel like XMAS around here
next week!

Hi to All..

I´m a Swedish amateur who got a TS820 as a birthday present in July from a friend. This "rig" has been standing on a shelf at a car company for at least 10 years. I have checked out "The Groups" message and found a couple of answers who was related to some Rx-problems and now the transceiver is tuned up and working properly.

Thanks for all the tips and hints to the members of the group.

I´ve only had my license for three years so now it´s time for the "lower band", normally working on vhf and uhf in Stockholm.

Check out my last name according to the callsign, been waiting a long time for that "one".

Good DXing

Wow Max,
Yes, I know what that feeling is like. I love it when I buy myself
things to play with.
Last week I upgraded my computer monitor with a 19" flat screen. I had
already upgraded the other 2 computers to 17" flat screens.
Week before that I bought a new Freq Counter and before that I bought
some other stuff along with new 300 gig hard drives for all 3
computers. Yesterday I ordered some new Probes for the scope.
By XMAS time, I should already have everything I need. hi hi.
I can tell you, I am sure you will be impressed with the Product
Detector mod.
I am shipping the first 100 Diodes out tomorrow. (well actually the
first 92.) I will ship the rest on Monday.
I so far have orders for almost 150 of them. Luckily I ordered the
extra 100.
73,
Gordon

Hello Walt,
I have your 8 diodes ready to ship. I set you up with a full matched
set of 8 diodes.
the cost is 11 cents each which is 88 cents plus 30 cents for the
padded envelope and 78 cents shippin. Total of $ 1.96
If you wish to pay with paypal, you will need to add 36 cents to cover
the charges they will charge me. I am doing this at NO profit at all to me.

I would like to be on your list.I am new to the group and picked up a 830s about 2 weeks ago. My first mod will be to change out C106. I have the new cap. Just need time to do it.How much better is the radio with the Schottky Diodes?
Chris W7CTH

Gordon <n6wk@...> wrote: Hi All,
Because of the great response I received about the Schottky Diodes,
I ordered another 100 of them. This way I will be able to match
everyones diode order very closely. I want you all to get diodes that
are matched as close as I can get them.
So, I will be able to fill everyones order.
At 11 cents each, I don't think anyone can go wrong.
Thanks Guys.
All orders should ship by Saturday.

Hi Chris,
I find the Diodes make a nice difference in lowering the noise floor.
I will put you down for 4 diodes to do the Product detector Mod on the 830.
Welcome aboard the group.
73,
Gordon

Gordon,

I was wondering if there is any kind of a mod like
that
for the TS-820?

Maybe I should trade my TS-820S for an 830.

tnx,
de Bill, N4DH

9918. Tuning up TS-830s

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-07 04:12:21 UTC
From: Kevin Keyes
Topic: 9918 Message: 9918

I'm new owner of a TS-830s and have some questions regarding the tuning procedure.

1.) What is the ideal plate reading in mA? I have read anything from 225 to 265 mA. I understand that higher mA reduces the life expectancy of the tubes.

2.) I am unable to achieve anything close to 200 mA when tuning up on 80 meters. Do lower frequencies cause a loss of mA or am I not doing something right?

3.) I find the midpoint of the band on which I am authorized to operate and tune up. Do I need to retune as I move away from the midpoint?

4.) I use SSB exclussively. However, part of the manual's tune up procedure calls for placing the mode switch to CW, closing the key and redipping the plate and repeaking the load. Is this a necessary procedure since I don't use CW?

Many thanks in advance. This is a great radio and I just want to make sure I'm using it correctly to its fullest potential.

73,
Kevin - KI4KFS

Jim that's great news. It took me several months of sporadic troubleshooting to find that failed resistor, then 99 cents at Radio Shack to fix it. I learned a lot though, and it makes running the 830s just that much sweeter.

Regards,
Pete KE5CTT

> Gordon made a believer of me; check the rectifier board components. When I was checking the sidetone circuit, I removed each component and measured it either with DVM or my capacitor meter. The zener I checked by setting up a little circuit on the bench to see if it regulated at 9 vdc. I was really discouraged when all the parts checked out OK. I went ahead and replaced the transistor and zener diode anyway, to no avail until I checked and found R13 open. Now everything works hunky dorry. And I saved the cost of a repair plus 2way shipping!

Topic: 9918 Message: 9921

Hi Kevin,
My suggestion is to go to K4EAA Kens web site and he explains exactly
how to tune the Kenwood TS-830S up. I believe this is his web site.
www.dbeweb.com/Kenwood/ If this is not the web site just Google Search
his call. Hope this helps.

Just curious about all the Schottky "upgrade" talk. Has this not been coverd many moons ago in QST etc, and it was found that although the noise floor is "apparently" lowered, it is -in effect- just an illusion, as the input RF signals are also lowered by the same same amount? When a schottky upgrade was propsed and tried for the TS820, it was later found that it really made no differnce to the actual s/n ratio.

Perhaps the particular replacment part number has changed since the original findings, but just thought I'd let you know to read up on past writings about this mod. Perhaps someone can comment about what may have changed since original testing proved a schottkey replacemnt was not as great as it seemed, when actually checked with test gear.

820 Ellen:

I understand it helps most rigs that had germanium diodes in ring modulators and detectors. The Yaesu group has been doing this to FT-101s for years. I am going to try this in my 820S when I get time. I already have the diodes.

It will be a few weeks, but when I modify mine, I will check the sensitivity. However I have been planning this not so much as to lower the noise floor but to reduce distortion products in the modulator and product detector. The Schottkys switch faster and distortion is reduced.

Thy have been doing this to Yaesus since the 70's with good results. I note that Ten Tec uses schottky diodes in their later rigs such as the Paragon.

I played around with the RF-IF FET change mod in the late 70's. At that time I questioned whether it made any noticeable difference. However I am revisiting it and waiting on specific information. The change was to replace the 3SK35 front end and the 3SK40 IF MOS FETs with NTE 222.

If you operate SSB and want the receive of a TS-820 to sound nice, change the filter to an INRAD model 88. and then make the diode changes in the modulator and product detector. I can't personally vouch for the diode changes yet, but I have heard of good results for years and it can't hurt. I am convinced enough that I plan to try it. I can vouch for the model 88 filter. I spent $99 US for the filter and put it in a radio that cost me $45.00. It was the best investment I have made in years!

Hi Ellen and all,

I'm about to start the Inrad mods to replace the original noisy dual-gate mosfets (Q2, 3, 6 &7) on
the RF board.
All this talk of reducing noise by replacing diodes makes me wonder if I'm barking up the wrong
tree...

Maybe both mods should be done?

Ok this will be fun. The 830 that I have is new. My friend had it on the air for a short time and it has been in the kenwood box for a long time.
Let me know how I can pay you for them.
Thank you
Chris,,

Hi Bill,
The setup is almost Identical on the 820 and the 830. Therefore, I see
no reason why the 820 would not benefit from the Product detector mod as
much as the 830. I'm sure someone will correct me if I am missing something.

On the 820 you would swap out Diodes D35,36,37 and D38. Then you would
add the 100 ohm resistor from the junction point of R 115 and R116 to Ground
Looks pretty much like the same procedure.

Hi to All..

I´m a Swedish amateur who got a TS820 as a birthday present in July
from a friend. This "rig" has been standing on a shelf at a
car company for at least 10 years. I have checked out "The Groups"
message and found a couple of answers who was related to some Rx-
problems and now the transceiver is tuned up and working properly.

Thanks for all the tips and hints to the members of the group.

I´ve only had my license for three years so now it´s time for
the "lower band", normally working on vhf and uhf in Stockholm.

Check out my last name according to the callsign, been waiting a long
time for that "one".

I just did a upgrade to Gen class in Aug. I was looking to buy a new HF rig. Now that I made a trade to get a 830s for free. The money went into a Nikon D200 camera. I like the look of the 830S and this group Plus all the Mods you can do to make the 830 a better radio. Anyone know a good place to buy the tubes for the 830s? I have a Kenwood 520S that works if anyone would like to buy it.

From: subriaus
Topic: 9932 Message: 9932

Hi

I recently got a ts-520 in my hand and been trying to get the
rig properly tuned up.
This is what happens: Tune up according to manual
-the meter switch in ALC .. CAR at min pos.. flip to SEND and peak with
DRIVE..no ind on ALC so I increase CAR and ALC coming.
At a certain point the ALC goes wild starting to "pump" between max
and min indication. This happens at a very low CAR setting maybe 9
oclock.
I am suspecting the 12BY7a tube but I am not quite sure.
Anyone ??

Thanks
Frank

Thanks Max and Walt
I am still a bit confused though. The service manual says that there is an adjustment on the VFO unit to set the frequency offset on transmit to 800 Hz.

At 05:06 AM 10/6/2006, you wrote:

Hi Bill,
The setup is almost Identical on the 820 and the 830. Therefore, I see no reason why the 820 would not benefit from the Product detector mod as much as the 830.
I'm sure someone will correct me if I am missing something.

On the 820 you would swap out Diodes D9,10,11 and D12.
I errored earlier with the diodes that needed to be swapped out on the 820.

9937. Diode replacement

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-07 17:10:42 UTC
From: w5mhl
Topic: 9937 Message: 9937

I have taken Gordon up on his kind offer to supply replacement diodes for the TS-830. However I wonder if they really improve the sensitivity, or simply lower the gain. I have never had a situation at HF where the atmospheric noise with antenna attached did not overide the inherent receiver noise. Also in a well designed receiver with proper gain distribution, the ultimate S.N. ratio will be determined by the front end. This assumes that the noise floor being discussed is the level achieved with no antenna attached.

When I receive the diodes, I'll try to make an actual comparison of sensitivity, before and after.

Am I missing something here? Comments?

Jim, w5mhl

Item 7 on page 34 of the service manual calls for the adjustment of
L4 on the VFO to set the CW shift to 800+-50 Hz.
Page 42 shows the location of L4 on the VFO and references "CWT 800 HZ up"

From: Rick May
Topic: 9875 Message: 9939

Hi Greg,

I did the first product detector mod on my 830S some months ago. I was amazed at the improvement. I could not listen to the 830S for more than few minutes with headphones because of the high static and white noise level... My Icom 765 has a much quieter front end but still excellent sensitivity. Now, when I do the A/B test with a coax switch, I can't tell them apart. Now I don't know if my 830S had a noisier receiver than most but I posted a spectrum scan plot of my before and after receiver noise. At least for me, it iwas a dramatic improvement for about a $4 investment....I think Gordon was similarly impressed.

Greg <va3vfo@...> wrote: Just curious about all the Schottky "upgrade" talk. Has this not been coverd many moons ago in QST etc, and it was found that
although the noise floor is "apparently" lowered, it is -in effect-
just an illusion, as the input RF signals are also lowered by the
same same amount? When a schottky upgrade was propsed and tried for
the TS820, it was later found that it really made no differnce to
the actual s/n ratio.

Perhaps the particular replacment part number has changed since the
original findings, but just thought I'd let you know to read up on
past writings about this mod. Perhaps someone can comment about what
may have changed since original testing proved a schottkey
replacemnt was not as great as it seemed, when actually checked with
test gear.

Hi Walt, could you let me know what the diode #s are on the board (I'm just feeling lazy, and don't feel like poring over the schematic, LOL)? I have mixed feelings about this. I'd love to improve my baby's performance, but by the same token, as a classic/now becoming collectable rig, I'm leery about messing with its originality.

I've been down the tube road myself, with my TS-820 in recent months. First and foremost, DON'T BUY THE CHINESE 6146Bs. They are made nowhere near as well as a set of NOS GEs or Phillips/Sylvanias. I made the mistake of putting a set of Chinese 6146Ws in my TS-820 a few months back, and when I turned on the cathode heaters, the tubes flashed over. The result - I had to replace fried resistors on the High Voltage, and Finals boards. The Chinese 6146Ws don't take too well to the higher voltages, that Kenwood hybrids run.

With that thought in mind here are your best tube choices:
1. J2000 - this a Japanese variant of the 6146B, and is the original tube that was installed in these radios. With a set of J2000s, a Kenwood hybrid can do 120-125W out (about 105-110 out on 10m). Unfortunatly, they are virtually impossible to find nowadays. If you can find an NOS set, consider yourself lucky. So for finals replacements, you'll have to turn to the 6146 family of tubes.

2. 6146B - this is tube choice number 2 for the Kenwood hybrids. With a set of these in, you can expect anywhere from 105 to 120W output. Unfortunatley (although not as much as with the J2000), 6146Bs are getting scarce. Back in the mid 80s, when I was a new General going to the Univ. of WI for an engineering degree, I was able to buy a set of 6146Bs from a local electronics surplus house for about $40. Radio Shack was able to get them for me back then, for about $25 a piece. Nowadays you either have to get them on e-bay or at a hamfest. Also, a few months back Nebraska Surplus was selling them for about $40-$50 a piece.

3. 6146W - This is what most of us (and other hams with rigs that have 6146 finals in them) use nowadays. This is a militarized variant of the 6146B. With a set of these installed in a Kenwood hybrid, you should be able to get about 105-120W out of it. These are still readily available, if you know where to look. Antique Electronics, and Nebraska Surplus, and RF Parts are three suppliers that come to mind for these. I bought the JAN Phillips/Sylvania 6146Ws for my 820. They cost a bit more than some of the other available 6146Ws (but were actually close to price for the Chinese ripoffs I bought from a major ham retailer), but they've worked great form me, and I'm glad I bought them. I get about 105-110W out of Old Bessie with them in.

OK, that does it for the finals. For the 12BY7A driver, there is no one preferred brand of tube, other than to say that some 12BY7As (irregardless of brand), may work better with your Kenwood than others. It might end up being a trial and error thing with 12BY7As.

73,
Ellen - AF9J

Greetings and welcome to the group. My name is John the call is KA3DPW.
I think you'll find the experience with the radio you now have to be an interesting one. Having this group to inquire to is a valuable tool to keeping it going.

I've been here for a few months now, and I see things going on day to day here. One day it's atransformer, next it's a modand maybe a band switch needs cleaning on someone else's radio. Right now there's interest in a mod for swapping doides to see if there is a quieter noise floor and perhaps better performance.

I watch, listen and learn. There's some well experienced people here and even some people who work on these as shop repair. Some you see in here day to day but still others only occasionally. There is a good sized group here along with a nice archive of mods and tests and repairs and such. Within a reasonable amount of time when you call for something to the group, a response comes back. Some are more knowledgeable at a 520 or an 830 or an 820 others are more ve4rsatile to several models and yet some to all Kenwood tube Hybrids.

So welcome and do tell what you got for the radio. I believer you said an 830 am I correct? Did it have a microphone or straight key? was there any accessories, like the matching speaker or a remoter VFO or a transverter?

Back to you. DE KA3PW K

Ellen,

The detector diodes are either D20-24 or D19-23 can't remember. The
modulator diodes are D28-31.

Max

I think you'll find the experience with the radio you now have to be an interesting one. Having this group to inquire to is a valuable tool to keeping it going.

I've been here for a few months now, and I see things going on day to day here. One day it's atransformer, next it's a modand maybe a band switch needs cleaning on someone else's radio. Right now there's interest in a mod for swapping doides to see if there is a quieter noise floor and perhaps better performance.

I watch, listen and learn. There's some well experienced people here and even some people who work on these as shop repair. Some you see in here day to day but still others only occasionally. There is a good sized group here along with a nice archive of mods and tests and repairs and such. Within a reasonable amount of time when you call for something to the group, a response comes back. Some are more knowledgeable at a 520 or an 830 or an 820 others are more ve4rsatile to several models and yet some to all Kenwood tube Hybrids.

So welcome and do tell what you got for the radio. I believer you said an 830 am I correct? Did it have a microphone or straight key? was there any accessories, like the matching speaker or a remoter VFO or a transverter?

Back to you. DE KA3PW K

I've been running my 830S for the last couple of years, and really like this xmtr. When my transmit power went to zero recently, I found the output tubes had gone south. Not a problem; I have three sets of matched replacements. I installed a new set of GE 6146Bs. The tubes lit up, and I was able to tune up readily into a dummy load. Now, on to the neutralization process. Or was it?

The Operating Manual says "adjust TC1, reached through the adjustment hole in the top of the final section.)" No hole in the top of the cage (assume that's what they mean by the final section.) Two holes in the side - neither appear to go to anything like what I'm looking for. Service Manual shows TC1 in the middle of the PLL Unit - bottom of the xcvr. Yup, found that small adjustable cap. Just adjacent to T7-T12. Is that the puppy I'm supposed to be cranking on?

I've read all the correspondence on this site as well as all the help files, etc etc. I can't seem to correlate the "I shrink 2 pieces of shrink tubing, (double thickness) on the screwdriver shaft so it will not touch the edges of the hole in the cover." comments with what I'm seeing. What hole? What cover? If I have the right TC1, no access problem at all. Hmmmmm.....

Sorry if this is obvious to everyone else; sometimes the "little grey cells are not working."

Hi Bob, On the TS-830, The adjustment TC1 is on the Bottom side of the Final Cage. You have to access it from the bottom side. You must remiove the top and bottom covers but do NOT take the final cover off.
Look on page 31 of your user Manual. It shows where TC1 is located in the Top Picture. (the Bottom View)

TC1 is found on the bottom side of the final unit. It's near the front, left ft corner (viewed with the rig upside down and the front facing away from you). Look at page 10 of the service manual, the bottom view. On the upper right side of the photo you should see a caption "TC1 Neutralization".

9951. TS-830s project.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-08 00:35:31 UTC
From: David Rust
Topic: 9951 Message: 9951

Here is where I am with the TS830s I got Friday.

HV reads about 550 volts, shows its drawing 225 to 250 mils IP when its loaded up, however, the power output on a Drake W4 shows 35 watts on all bands. Slightly less on 15 meters, didn't go on up in frequency.

I tightened all the board to chassis screws, some of them were loose, but not real loose. I changed driver tubes, I don't think there was a new one in it, but that didn't change anything. To drive the ALC to the top of the ALC scale when speaking into the mike I had to run the Mike gain up to 8 on the scale. It is loaded up to 225 mils in the cw position, flip to transmit in USB or LSB and it will only peak at 35 to 40 watts on a Drake W4 wattmeter, same in the CW position and keyed. 35 watts out. Idle current is set to 60 mils, HV reads just slightly over 500 volts in the transmit position. My 530s reads up around 900 volts. So....now what.

One more thing about the 830s. The HV reads about 500 volts with the filament voltage on and in any mode position. With the filament switch off it will read just slightly over 800 volts HV if I momentarily switch it in transmit mode.

Dave,
500 Volts is way Low. Either something is really pulling the voltage down, or there is a problem in the HV circuit. I would check all the diodes and compontents on the Rectifier board to start with. I'm suspecting a problem there.

Nope it's the two big black ones mounted on the chassis in the middle
of the radio (right behind the display unit). 100UF @ 500v. One has
opened up and not doubling the HV.

Topic: 9937 Message: 9959

Commenting on this further,

Diodes make noise. While not more than atmospheric noise, noise is additive. Diode noise is one of the many hisses you hear in a receiver when it is attached to a dummy load. Since Schottkys are quieter, the additive noise should be lower. I have not done this mod yet, but what Gordon and Max say makes sense. What they will surely do is create less distortion in the modulated and demodulated signal. This is because the Schottkys snap faster.

By snap, I mean that diodes conduct one way but not the other. In OVERSIMPLIFIED theory, if a positive voltage is applied to the anode of a germanium,silicon, or schottky diode, (this does not apply to zeners) current (electrons) will flow from the - cathode to the positive anode. As the positive voltage is reduced to zero and then becomes a negative voltage, the current flow stops when the electron flow reverses.

This action is like a check valve in plumbing. It allows water to flow one direction but when it tries to flow the other, it shuts off.

Now, you note that I said OVERSIMPLIFIED.

That is because the cut off point does not occur at exactly +/- 0 volts. With a silicon diode, when the anode is slightly positive, current flow does not occur until the positive voltage reaches .6 to .7 volts. With germanium diodes this is around .2 volts, and with Schottky diodes, this is lower than that closest to zero of any of them.

Another factor is snap or switching speed. When a rapidly changing signal such as an audio or RF signal is applied, when the conduction point is reached, cut on, off does not happen immediately. This conduction initializes over a time period, very short, never the less, a time period. This snap or switching rate is different from diode to diode, but Schottkys generally have much faster switching rates than other diodes except for some microwave diodes. The faster and lower snap voltage causes less dead spots as the audio or RF wave changes from + to - and thus creates less distortion. This would be akin to having less cross-over distortion in a push pull amplifier.

How much improvement you will notice depends on how critical your ear is. If you enjoy the sound of a cell phone do not worry about any of this. Bit even if you are hard of hearing, particularly from high frequency loss, cleaner lower distortion audio will be beneficial to you.

Since Max and Gordon are hearing weak signals better, something is happening. Whether it is a better s/n ratio or less intermodulation products between the noises complicating the signal, the result seems to be beneficial.

And one benefit very well could be that with lower distortion on receive, the complex noise is generating less intermodulation products.

Subject: [TS-520_820_530_830] Diode replacement

I have taken Gordon up on his kind offer to supply replacement diodes
for the TS-830. However I wonder if they really improve the
sensitivity, or simply lower the gain. I have never had a situation
at HF where the atmospheric noise with antenna attached did not
overide the inherent receiver noise. Also in a well designed receiver
with proper gain distribution, the ultimate S.N. ratio will be
determined by the front end. This assumes that the noise floor being
discussed is the level achieved with no antenna attached.

When I receive the diodes, I'll try to make an actual comparison of
sensitivity, before and after.

Am I missing something here? Comments?

Jim, w5mhl

9961. Diodes in TS-820, numbers, 1n5711 Schottky Diodes

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-08 09:35:15 UTC
From: n9wb
Topic: 9961 Message: 9961

Diodes to change to 1N5711 Schottky diodes in the TS-820 and TS-820S.

Main modulator and product detector:

D-9, D-10, D-11, and D-12 are the diodes to change for the product detector.

D-26, D-27, D-28, and D-29 are the diodes for the main balanced modulator.
.....
.....
If you use the speech processor in the TS-820 very often, you may eventually wish to consider changing the processor diodes also. It can't do anything but reduce distortion in the processor a bit. I am not sure if I will or not because I soon will be using another external processor. But I am providing the information for your use.

In the TS-820, TS-820S RF speech processor:

D-31, D-32, D-33, and D-34 are the modulator diodes at the input of the RF speech processor.

D-35, D-36, D-37, and D-38 are the product detector diodes at the RF speech processor output.

Ellen:

While I hate to see rigs butchered up with a lot of modifications, I would not worry about changing diodes one for one in the TS-820 for reasons of originality.

I certainly would be concerned about radical modifications that involved a lot of changes and foil modifications such as, WARC mods, QRO mods (yuck!), drilling holes, particularly in the front panel, and things like that. But changing diodes is like using improved spark plugs that fit exactly without modification in a classic car.

I also would not be concerned about changing a filter to an INRAD if it was an exact fit.

I am not sure that I am sold on the FET changes either, but I am looking into it.

My opinion,

Walt N9WB

PS: Thanks Gordon for providing me with clear documentation to look these up on. Walt

Bob:

We like to keep this as confusing as possible just so we can keep you on your toes.Hi (not really, but I know sometimes it must seem that way to you all. I'm sorry for that but we try.)

On the TS-830 there is no hole in the top of the final section. TC-1 is the capacitor that you need access to. It is pictured on the top diagram on page 31 of your instruction manual for the TS-830.

The TS-820 has a hole in the top for access. The cover must be on to do this. It makes this process miserable. Be thankful that you are neutralizing a TS-830.

Probably you either have an open High voltage rectifier diode, or bad high voltage filter capacitors. However, if you have a volt meter that will measure 900 volts safely, measure the voltage at the point labeled HV on the rectifier unit. If you read around 800 V there, disregard the above and we will have you check some other things.

If you cannot safely measure 900 volts, make a voltage divider to use a lower voltage meter. You will need (4) 1 meg ohm 1 watt resistors. Wire these in series and connect one end of the series string to the point labeled HV on the rectifier unit. Connect the other end of the series string to chassis ground. Connect the meter from ground to the first resistor above ground. There will be three more resistors between this point and the HV point. A correct reading for 800 volts would be 200 V. A correct reading for 500 v would be 125 volts. In other words, the meter reading times 4 will be the voltage at the HV point.

Be careful!

Very low line voltage when transmitting where the rig is plugged in will also do this. It would be very low. Around 80 volts. Be sure that your 220/120 volt switch is set properly.

Subject: [TS-520_820_530_830] TS-830s project.

Here is where I am with the TS830s I got Friday.

HV reads about 550 volts, shows its drawing 225 to 250 mils IP when its loaded up, however, the power output on a Drake W4 shows 35 watts on all bands. Slightly less on 15 meters, didn't go on up in frequency.

I tightened all the board to chassis screws, some of them were loose, but not real loose. I changed driver tubes, I don't think there was a new one in it, but that didn't change anything. To drive the ALC to the top of the ALC scale when speaking into the mike I had to run the Mike gain up to 8 on the scale. It is loaded up to 225 mils in the cw position, flip to transmit in USB or LSB and it will only peak at 35 to 40 watts on a Drake W4 wattmeter, same in the CW position and keyed. 35 watts out. Idle current is set to 60 mils, HV reads just slightly over 500 volts in the transmit position. My 530s reads up around 900 volts. So....now what.

Dave W0DLR

Check these things before following my earlier post.

I just read this post after I posted.
What I am thinking is instead of the High voltage dropping, the AC voltage into the transformer is dropping with load. If you are running extension cords, outlet strips or anything like that, be suspicious of them. Try eliminating them.

I would check the line voltage where the rig is connected when meter is showing 500 V.
Do the dial lights dim when you read 500 V ?
Also, as dumb as this sounds, if the dial lights dim, change the fuse. Be sure that the new one is the correct value.

If none of the above help,
On your transformer on the bottom, there are several taps labeled 0 Find the one associated with the one labeled 14. Measure the AC voltage between the one labeled 14 and it's associated 0. when the HV is reading low. It should read around 14 ACV.

Also measure AC volts between one of the taps labeled 120 and it's associated 0 tap when the plate voltage is low. If this voltage is less than 105 V suspect a bad outlet, or a bad on off switch in the rig.

Be very suspicious that somehow, low voltage is getting to the rig.
Resistance in series with the mains AC will cause this symptom. Resistance can be caused by a faulty plug, outlet, extension cord or power strip.

Subject: Re: [TS-520_820_530_830] TS-830s project.

One more thing about the 830s. The HV reads about 500 volts with the filament voltage on and in any mode position. With the filament switch off it will read just slightly over 800 volts HV if I momentarily switch it in transmit mode.

Walt,
Resistance can be caused by a faulty plug, outlet, extension cord or power strip.

It does the same thing on two different plug-ins in different parts of the house. I don't suspect the input voltage at this point.

That's ok. I knew what you meant. I have two 830's. One of which needs repair and one of which I use regularly. Others of this group have the goldline as well. I use the MC-50.

Remember that if you need to buy a microphne for the 830 get a high impedance mic. There are some different older models weork well with this mic too. For examples the Astatic D-104 works very well as does the Shure 444. Other members here in the group may be able to recommend more microphones.

Enjoy, as you have obtained a good radio that has the potential of may good QSO's and when properly set will produce a signal that comes back with good reports all the time. I know because it does for me all the time.

See you on the air.

John Harp <ka3dpw@...> wrote: Greetings and welcome to the group. My name is John the call is KA3DPW.
I think you'll find the experience with the radio you now have to be an interesting one. Having this group to inquire to is a valuable tool to keeping it going.

I've been here for a few months now, and I see things going on day to day here. One day it's atransformer, next it's a modand maybe a band switch needs cleaning on someone else's radio. Right now there's interest in a mod for swapping doides to see if there is a quieter noise floor and perhaps better performance.

I watch, listen and learn. There's some well experienced people here and even some people who work on these as shop repair. Some you see in here day to day but still others only occasionally. There is a good sized group here along with a nice archive of mods and tests and repairs and such. Within a reasonable amount of time when you call for something to the group, a response comes back. Some are more knowledgeable at a 520 or an 830 or an 820 others are more ve4rsatile to several models and yet some to all Kenwood tube Hybrids.

So welcome and do tell what you got for the radio. I believer you said an 830 am I correct? Did it have a microphone or straight key? was there any accessories, like the matching speaker or a remoter VFO or a transverter?

Back to you. DE KA3PW K

9970. Re: 830 Neutralization

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-08 19:21:18 UTC
From: nasa820
Topic: 9948 Message: 9970

Thanks to everyone for the info and advice. At this end, the little grey cells are still struggling.

I have the original Instruction and Service Manuals that came with this radio. I'm sure there were a number of editions. In any event, my page numbers and ilustrations don't always line up with some that were referenced. For example, the pictures are on page 36 of my manual (a foldout page) not page 31 as noted by Gordon. Not a big deal; I know where the pictures are and where the Final Unit is.

On Page 10 of the Service Manual (input from W6HV), the lower picture shows a view of the bottom of the unit. The Final Unit is in the upper right hand section. Kenwood calls it the Final Unit. It is commonly called the Final Cage by those in the group - I'm sure we're talking the same thing. Unfortunately, no caption "TC1 Neutralization" as noted by W6HV (or Gordon.) On page 11, there is a detailed schematic of the Final Unit Board - lower side(X56-1380-00.) No TC1 trim cap on that board. My unit physically matches the schematic.

TC1 IS shown on the PLL Unit board (X50-1680-00) on page 16 of the Service Manual. It is called out as "TC1 (10 Mhz)". In the Parts List, TC1 is shown as a 50 pF Ceramic trimmer, P/N C05-0029-15. But, wait! There is another TC1 - it's shown on the IF Board - it's a 100 pF ceramic trimmer with P/N C05-0314-05. It's shown as "CAR balance." Now that's a fine kettle of fish - two TC1's with different PN's and different values. But none in the Final Unit. Great Cuggily Muggily! (For what it's worth, there's yet another TC1 on the VFO board, with another PN and adjustment value.)

My Service Manual Adjustment Section calls out (Step 25) Neutralization Trimmer Adjustment as adjusting the "neutralization Trimmer", no component number mentioned. It also calls out no UNIT for the adjustment, as do most, if not all, of the others. However, Adjustment #7, "VFO, RIT FIX CH" and Adjustment #8 DO call out adjusting TC1 while adjusting the VFO or Counter on their units. (stands to reason.)

My little grey cells are starting to feel a little better, since it appears my problem is there is NO Neutralization Trimmer to be found on my rig! At least not on the Final Unit. That's why I couldn't find it. Now, where is that rascal? Or, maybe, I don't have to Neutralize!

My unit S/N 1040872. I don't know whether it is an early or late unit.

Bob, W7DDD, your think your pages don't match up, I just got a TS830s with a service manual and schematics. I had several pages that looked entirely different, down to the print style. I had already suspect something wasn't right, and sure enough after looking at some fine print, part of the schematic they sent me was for a Yaesu FT757gx. One has to be suspicious I guess.

From: sm0wid
Topic: 9974 Message: 9974

Thanks to KA3DPW , WB8UHZ , K4AXF.

The rig is a TS-820 nothing else.

I modified a Leson TX-232 microphone for this purpose and hopefully it will sound good.

I have changed all tubes to original one´s, I have had the tubes at my company for a while, lucky I didn´t sell them.

I also had to change the Tx-relay, I have American Zettler brandnew 12V relay different types which fits alright.

The RF power is aprox. 120 W "all ower" according to my PM330 dummyload after retuned.

I also had to renovate the VFO plastic/metalic wheel because it was stuck, a real finemechanical work with magnifying glass, file and surgical knife.

Had no problems with selectors, switches or potentiometers.

The Rx was quit alright exept the 40m who was tuned up using my TDS-220 , SG Marconi TF2015, Counter GFC-8100, and Nordmende SRG 389 (TG).

There is also a modification with a switch to the Rx close to the MF-filters, and I´m not sure if it is for supression or something, I´ll check it out later.

At this moment the "rig" is connected to a 10m dipolantenn horizontal South to North and also a vertical AH-7000 is available.

This week, hopefully, my specialdesigned L-antenn 40by40 will be mounted up on the roof West by East if the janitor doesn´t mind.

At this moment there is a 17 element uhf antenn, 10m dipol, Comet 250 uhf/vhf, AH-7000 discone and a Avanti 800-1300 Mhz commercial antenn approximately 75 meter over the sea. I got a real nice view over the capitol of Sweden, Stockholm up on the roof. The only problem is all the cable´s, because the lenght is 40 meter down to the apartment.

I have been working with "radios" since 1974 but I waited to take my licens until my friends "pushed me" to do it. I got 12 Hours to prepare and it was easy.

I´ve got a list of "tubes used and new" out on the Internet which is for sale real cheap. If it say´s "sålda" then it´s sold out.

The link is as follows:

Very Informative Post Walt.
Thank You !

73,
Gordon

--- In TS-520_820_530_830@yahoogroups.com, "n9wb" <n9wb@...> wrote:
>
> Commenting on this further,
>
> Diodes make noise. While not more than atmospheric noise, noise is additive. Diode noise is one of the many hisses you hear in a receiver when it is attached to a dummy load. Since Schottkys are quieter, the additive noise should be lower. I have not done this mod yet, but what Gordon and Max say makes sense. What they will surely do is create less distortion in the modulated and demodulated signal. This is because the Schottkys snap faster.
>
> By snap, I mean that diodes conduct one way but not the other. In OVERSIMPLIFIED theory, if a positive voltage is applied to the anode of a germanium,silicon, or schottky diode, (this does not apply to zeners) current (electrons) will flow from the - cathode to the positive anode. As the positive voltage is reduced to zero and then becomes a negative voltage, the current flow stops when the electron flow reverses.
>
> This action is like a check valve in plumbing. It allows water to flow one direction but when it tries to flow the other, it shuts off.
>
> Now, you note that I said OVERSIMPLIFIED.
>
> That is because the cut off point does not occur at exactly +/- 0 volts. With a silicon diode, when the anode is slightly positive, current flow does not occur until the positive voltage reaches .6 to .7 volts. With germanium diodes this is around .2 volts, and with Schottky diodes, this is lower than that closest to zero of any of them.
>
> Another factor is snap or switching speed. When a rapidly changing signal such as an audio or RF signal is applied, when the conduction point is reached, cut on, off does not happen immediately. This conduction initializes over a time period, very short, never the less, a time period. This snap or switching rate is different from diode to diode, but Schottkys generally have much faster switching rates than other diodes except for some microwave diodes. The faster and lower snap voltage causes less dead spots as the audio or RF wave changes

from + to - and thus creates less distortion. This would be akin to
having less cross-over distortion in a push pull amplifier.
>
> How much improvement you will notice depends on how critical your
ear is. If you enjoy the sound of a cell phone do not worry about any
of this. Bit even if you are hard of hearing, particularly from high
frequency loss, cleaner lower distortion audio will be beneficial to you.
>

It was my Pleasure Walt. I just did some of the 830, but the schematic
is so big, I had to put it on 2 sheets. However, the circuit traces
line up very well when placed together. I wish I had a better original
color schematic for the 830, but this one isn't all that bad.

From: Gordon
Topic: 9980 Message: 9980

I have sold all but 22 of the 200 Schottky diodes I had. I have 2 sets of four matched diodes and another set of 12 matched diodes left.
I shipped the first 100 on Saturday and the others are going out in Mondays mail. I even sent some to our brothers overseas.

73 to all.

Gordon

Hi Chris,

With most 12BY7A installations, unless things are really out of whack, you won't have to do any neutralization. BUT, with a new set of finals, you will have to neutralize them, to avoid spurious oscillations. Your manual should have a procedure for doing it. It should be pretty similar to the procedure my TS-820 has. Basically you're turning the neutralizing capacitor, for the lowest registered noise (as seen either in an O-scope, on an RF voltmeter, or a sensitve QRP wattmeter [that'll read at aleast as low as 1mW]). It's not hard to do, just tedious at times, and you have to be careful, in dealing with the voltages the finals have.

Topic: 9987 Message: 9987

I know this is probably more than a little silly to be asking but i am fairly new. I was reciently given a TS-830S with all the accessories except the SM-220, and was concerned all the documentation i have seen says the matching speaker is the sp-230 but I have an SP-820? is the sp-820 suppose to go with the TS-830 or some other kenwood rig? if anyone would like to trade for the sp-230 i would be more then willing to do that.

thanks for the info

Close,
The 820 says to Neutralize at 21.225
The TS-830 says to Neutralize at 28.800
Other then the location of the Neutralixation trimmer, it is the same.

Topic: 9980 Message: 9992

All of my 200 Schottky Diodes have now been purchased. I did this at NO profit but I did it to help all the fellow members.
Man, It was a lot of work to process the orders, match the diodes, package them and address the packages, but I did enjoy the fact that I am helping other Kenwood lovers ! Each person actually receives an Original N6WK QSL card as a Bonus.. hi hi..
If I receive enough requests for More, I will purchase another batch and match them for sale. Anyone interested, please contact me Off List. I have No problem sending them Overseas also. I enjoy helping others.
I am surprised at the response to requesting these diodes. I hope everyone is as pleased as Rick, Bill and I were with replacing them.
I think now, my TS-830 is the BEST hearing receiver I own.

Please, after you receive them and Install them, Let us know what you think also.

73,
Gordon

Subject: [TS-520_820_530_830] station question

I know this is probably more than a little silly to be asking but i am
fairly new. I was reciently given a TS-830S with all the accessories
except the SM-220, and was concerned all the documentation i have seen
says the matching speaker is the sp-230 but I have an SP-820? is the
sp-820 suppose to go with the TS-830 or some other kenwood rig? if
anyone would like to trade for the sp-230 i would be more then willing
to do that.

thanks for the info

Rick
My sample package of 50 gave the following measurements based on
different meter with new battery. Readings are taken after 5 seconds.

378 x 6 12%
379 x 19 38%
380 x 8 16%
381 x 15 30%
383 x 2 4%

380 is the average reading with the high of 383 and the low of 378
falling within 1% tolerance.

To my way of thinking one probably could not detect the difference
by ear even if these were not matched any closer than just using
them straight from the package.
Best regards from Vancouver

I have no idea and wish I had a scope so I could see what is
actually happening. After Gordon said how he is measuring the diodes
I dug out a small digital meter I had bought in ZL land a couple
years ago for $7.00 and it has a diode position on it. I do note
that the reading does drop over about 5 seconds and am assuming this
is due to junction temperature changing but who really knows without
proper test equipment.
best regards
Barry

According to the Mickey Mouse manual for my meter it is measuring
forward voltage drop. This may make sense in that the spec sheet for
1N5711 indicates max forward voltage at 1ma forward current to
be .41V

Walt,

Correct me if I am wrong but my impression was that if you are replacing old tubes with the same manufacture that you did not have to reneutralize. Is this true or not?

Bob:

We like to keep this as confusing as possible just so we can keep you on your toes.Hi (not really, but I know sometimes it must seem that way to you all. I'm sorry for that but we try.)

On the TS-830 there is no hole in the top of the final section. TC-1 is the capacitor that you need access to. It is pictured on the top diagram on page 31 of your instruction manual for the TS-830.

The TS-820 has a hole in the top for access. The cover must be on to do this. It makes this process miserable. Be thankful that you are neutralizing a TS-830.

Subject: [TS-520_820_530_830] 830 Neutralization

I've been running my 830S for the last couple of years, and really like this xmtr. When my transmit power went to zero recently, I found the output tubes had gone south. Not a problem; I have three sets of matched replacements. I installed a new set of GE 6146Bs. The tubes lit up, and I was able to tune up readily into a dummy load. Now, on to the neutralization process. Or was it?

The Operating Manual says "adjust TC1, reached through the adjustment hole in the top of the final section.)" No hole in the top of the cage (assume that's what they mean by the final section.) Two holes in the side - neither appear to go to anything like what I'm looking for. Service Manual shows TC1 in the middle of the PLL Unit - bottom of the xcvr. Yup, found that small adjustable cap. Just adjacent to T7-T12. Is that the puppy I'm supposed to be cranking on?

I've read all the correspondence on this site as well as all the help files, etc etc. I can't seem to correlate the "I shrink 2 pieces of shrink tubing, (double thickness) on the screwdriver shaft so it will not touch the edges of the hole in the cover." comments with what I'm seeing. What hole? What cover? If I have the right TC1, no access problem at all. Hmmmmm.....

Sorry if this is obvious to everyone else; sometimes the "little grey cells are not working."

Date: 2006-10-09 15:19:10 UTC
From: drownut
Topic: 10004 Message: 10004

I am new to the list and have been reading the mail for just a week or so. I have a TS-830-s that I have owned since 1982 which has seen little or no use for the past 12 years. I have recently reactivated my interest in amateur radio and have installed a new TS 2000 station. It's OK, however, I miss the involvement of tuning up my 830 and twisting the dials, etc. I put it on the air last week and made a contact with a friend who said it sounded just like the 2000, if not better. However, it is a devil to tune now and seems to have an intermittant in the mic circuit (could be the mic., MC-160 or some unrelated problem).

I am envious of the knowledge of the list participants here and actually am intimidated through MY lack of knowledge about our great Kenwood hybrid gear. Be that as it may, I want to get this station (TS-830s, SP-230, VFO-230, and AT-230) back on the air in good order. I need a suggestion as to who I cand send the 830-s to for a good going over (alignment, tubes, WARC enableing, etc.). The unit looks like new and has been treated well over the years of use I have put it through.

Any suggestions as to who might be able to bring this gem back to full life?

Many thanks in advance,

Dave

Personally I would go to my user manual and first of all tune it as per manual and see if it's
all working as it should. Go piece by piece and check the function of each and every accessory.
Compare it to the manual and see what you get.
You'll probably find that it's in working order. If not, there are plenty of people here that can help.
Post your findings to the group. Sounds like you have a nice setup there.

Dave
Welcome to the list. I feel much the same as you re rig repair but can assure you that if you can use a multimeter and solder iron there is nothing in these rigs you can't repair. All the help and advice you need is right here and the feeling of satisfaction will far outweigh simply having an operating station. All you have to do is follow the step by step procedures these "experts" will outline and you will soon be saying "I did it".
best regards
Barry

Dave, I agree with Barry.

Don't feel intimidated by your radio. I consider myself a hammer and anvil technician, but I'm not afraid of one of them. I didn't know anything about a repeater years ago, and still don't know much, but I have had one on the air for 7 or 8 years with good success.

After watching and reading these posts for a while, I know this group can walk you though darn near anything. So, start asking questions, we'll all try to help you. I have a 530S and an 830s, and just love both of them. In fact I feel very fortunate to got a hand on them, both of them being in very good condition.

Let us hear from you.

I just did a upgrade to Gen class in Aug. I was looking to buy a new HF rig. Now that I made a trade to get a 830s for free. The money went into a Nikon D200 camera. I like the look of the 830S and this group Plus all the Mods you can do to make the 830 a better radio. Anyone know a good place to buy the tubes for the 830s? I have a Kenwood 520S that works if anyone would like to buy it.

Hi to All..

I´m a Swedish amateur who got a TS820 as a birthday present in July from a friend. This "rig" has been standing on a shelf at a car company for at least 10 years. I have checked out "The Groups" message and found a couple of answers who was related to some Rx-problems and now the transceiver is tuned up and working properly.

Thanks for all the tips and hints to the members of the group.

I´ve only had my license for three years so now ít´s time for
the "lower band", normally working on vhf and uhf in Stockholm.

Check out my last name according to the callsign, been waiting a long
time for that "one".

Topic: 9995 Message: 10009

Good Morning Rick,

All of the 200 Diodes I have tested so far from these two batches
have read between 457 and 461 except for 4 that read 469, 451 and 2 at
452 . I went back and rechecked the ones from you and they still check
in the 470 range, so it's not something in the meter.
Although the readings were lower then the 8 I received from you,
they all seem to be well within a 1% tolerence.
I'll let you know how the next batch tests out also.
73,
Gordon

Hi Barry,
I do notice that on my meter the reading may drop one number after
5 seconds, but not always. Interesting stuff.

Thanks for the offer to step me through my 830s difficulties. I will do what is necessary to tune up the transmitter and take notes as to how it behaves at each step or where it misbehaves and post the results. First I have to finish winterizing the doghouse.

Dave

Hi Gordon,

OK..Interesting.. Is there a Vishay batch number on the plastic envelopes you received? There seems to be good uniformity between them all. I bought the ones I got last Winter as 1% tolerance so if that is the difference or just a different batch number I am not sure. Max is getting the original Vishay anti-static envelope I received them in so he can look for a batch number if there is one....

I use the MC-50 with my 830 and have always received great audio reports. It gets a 5.0 on eHam reviews. I've never had to turn the mic gain up past about 3.0 which is about the 9 o'clock position, to get the onscale ALC reading called out in the Manual.

I've also used an unamplified D-130 Silver Eagle without problem, but have assigned that mic full-time to my Swan.

Hi Gordon,

If the diode tester is measuring the voltage drop across the junction,
I wonder what the voltage threshold is for firing the diode...Did you receive the spec sheet on the 1N5711's ? This is intersting stuff....

I have just completed swapping out all 16 diodes on the IF board that Gordon refers to.
One word will sum up the results. WOW!!!!
Of course this is a subjective measurement based solely on my hearing ability. Either the 20M band opened up this afterneoon or we have done something really good to this 820S.

Neutralization Update from W7DDD.

Well, with the excellent help from this group, I found the neutralization trim screw hiding beneath a wire bundle. Never called out in my Manual. So, on to the job. I checked and reset the bias and checked the driver tube per K0ZL. All OK. The xmtr tuned up just fine into a dummy load. Since my oscilloscope is only good for 20Mhz, and I don't have a sensitive RF millivoltmeter, I went down two of N9WB alternate routes.

Using a "cheap" CB SWR meter, I couldn't get any reading even with the gain knob turned up all the way. Then I installed a Swan WM-200 wattmeter and, with the SG switch ON, used the power peak/current dip method he mentions. They seemed to be bang on.

So I hooked her up and made half a dozen contacts on 40 and 20 meters. All gave me good audio reports. Power output on my Array Solutions PowerMaster Wattmeter was running 100-115 watts. I checked into my nets this morning (where they know my voice), and they said the audio was great.

Now, I've never adjusted this trim cap that I looked so hard for! I've thought of doing a neutralization using my oscilloscope down on 20 meters. But, I've also thought of 'declaring victory' and moving on.

Comments?

Bob

Barry,

That pretty much sums up my experience with my 830S after doing the same swap. Like I said, I thought I forgot to re-connect something on the I.F. board when I turned the radio back on. It was way too quiet. This was last Winter and I worked several low power (10 watt) U.K. stations on 40 meter SSB because I could hear them....

Poor Gordon ...look what we started..Just because I was raving to him on 20 meters how quiet the Kenwood was now and had 17 extra diodes on hand.

It made sense it would work in the 820 also ...same diode ring design.

Rick KC0HH

digs4ruff <digs4ruff@...> wrote: I have just completed swapping out all 16 diodes on the IF board that
Gordon refers to.
One word will sum up the results. WOW!!!!
Of course this is a subjective measurement based solely on my hearing
ability. Either the 20M band opened up this afterneoon or we have done
something really good to this 820S.

Thanks for the Results Barry.
That makes four of us that agree on this so far.
I was Impressed with the results as soon as I turned the radio on
after making the Mod, especially for the Weak signal stations.
We should make a list of the diodes to swap out on each of the
models 520 / 820 and the 530 / 830. I know which ones on the 820 and
830, but I haven't had time to look what the numbers are on the 520
and 530.
I'll look them up later today and post them so everyone will have that
info for their respective rig.

73,
Gordon

Although your 'scope is only 20 MHz that just means it's accurate to there. It will show a trace up to probably 40MHz. You are not interested in the level just getting a trace and setting the cap for minimum. Unless the neutralization is way off a wattmeter is useless for setting neutralization. It won't read near low enough. Just make sure and use a tap and don't connect the 'scope directly to the ant connection.

Has anybody happened to do a before and after reading on the Minimum Discernable Signal (MDS)?? I take readings by ear with a huge grain of salt... Most 830's I have seen are in the -138-140 range stock.

Hi Clif,

I, for one, don't have anything to measure MDS. What I have been doing is comparing it to my 765 which has an excellent receiver. Although it was aligned by someone who knew what they were doing. Hi...What is the typical MDS for the Icom as the two are identical now in doing A/B comparisons? This is with the 765 preamp turned on.

My processor in the 830S I use quit working a while back. Day off, so I thought I would look at things. With Proc turned off, good audio output with ALC reading adjusted by mic gain. When I push the proc button, I show deflection on the meter set to comp and the comp level works, but no output and no ALC indication. I found what looks like a broken connection behind the front panel ...It is the shields of the 3 white wires to the processor switch ganged together with the ends covered in heatshrink. It looks like it should be connected to the rear of the Proc button but there is no evidence of a wire having broken off there.

I don't use the processor that often but it annoys me it isn't working. I have been staring at schematics until I am cross eyed... Anyone out there have their top cover off their 830S

Clif, I agree and hope to make some quantitative measurements when I replace the diodes. I am not sure what is meant by noise floor, but some measure of sensitivity is needed. This of course will depend on the receiver bandwidth and how the MDS is defined. A -138 to -140 should be adequate for the HF bands.

10031. RX response after mod

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-09 21:13:04 UTC
From: max_ve3tmt
Topic: 10031 Message: 10031

As if we don't have enough to do, I replaced some caps on the AF board of my 830 in an attempt to get a better low end response. I have posted a picture of my sweep in the photo section under my callsign. Definitely looks like there is some improvement.

Caps I replaced were C11, C20, C23 and C87.

The first 3 were .47uf, I swapped them for 2.2uf. C87 is a .01uf which I swapped for a .001uf. I didn't bother changing the large electrolytic on the output of the main audio amp as my audio is tapped off before the AF GAIN control anyway.

If you tackle this mod note you do not have to rempve the AF board from the heat sink. Simply remove the three screws holding the heatsiink and the 2 circuit board screws on the right side of the board and the whole assembly will flip over. I was going to wait until my new diodes arrived but curiousity got the better of me!

Topic: 9948 Message: 10033

Hey I used a cheap little CB/wattmeter from radio shack to neutralize mine in a pinch once. I used the FSM side and looked for a dip. I took the antenna off it and rapped several turns around the coax lead to the dummy load as I remember. it generated enough signal ti raise the needle. Then I dipped the meter for the lowest setting at 28.5. It worked for me in a pinch. Try it.

nasa820 <nasa820@...> wrote: Neutralization Update from W7DDD.

Well, with the excellent help from this group, I found the
neutralization trim screw hiding beneath a wire bundle. Never called
out in my Manual. So, on to the job. I checked and reset the bias
and checked the driver tube per K0ZL. All OK. The xmtr tuned up
just fine into a dummy load. Since my oscilloscope is only good for
20Mhz, and I don't have a sensitive RF millivoltmeter, I went down two
of N9WB alternate routes.

Using a "cheap" CB SWR meter, I couldn't get any reading even with the
gain knob turned up all the way. Then I installed a Swan WM-200
wattmeter and, with the SG switch ON, used the power peak/current dip
method he mentions. They seemed to be bang on.

So I hooked her up and made half a dozen contacts on 40 and 20 meters.
All gave me good audio reports. Power output on my Array Solutions
PowerMaster Wattmeter was running 100-115 watts. I checked into my
nets this morning (where they know my voice), and they said the audio
was great.

Now, I've never adjusted this trim cap that I looked so hard for!
I've thought of doing a neutralization using my oscilloscope down on
20 meters. But, I've also thought of 'declaring victory' and moving on.

Comments?

I just did a upgrade to Gen class in Aug. I was looking to buy a new HF rig. Now that I made a trade to get a 830s for free. The money went into a Nikon D200 camera. I like the look of the 830S and this group Plus all the Mods you can do to make the 830 a better radio. Anyone know a good place to buy the tubes for the 830s? I have a Kenwood 520S that works if anyone would like to buy it.

Hi to All..

I´m a Swedish amateur who got a TS820 as a birthday present in July
from a friend. This "rig" has been standing on a shelf at a

car company for at least 10 years. I have checked out "The Groups"
message and found a couple of answers who was related to some Rx-
problems and now the transceiver is tuned up and working properly.

Thanks for all the tips and hints to the members of the group.

I´ve only had my license for three years so now ít´s time for
the "lower band", normally working on vhf and uhf in Stockholm.

Check out my last name according to the callsign, been waiting a long
time for that "one".

Good DXing

Well there's a few members who do the work here in the group. Why not do it yourself. We do it. I'm no exception and I'm not just all thumbs.
Start by checking the wiring of the mic. Use a voltmeter to verify the pins.
Remember the one end is 4 pins and one is 5 pins. Use your wiring diagram to find the wiring.
Also if your 830 sat that long, why not go in and clean it. You'll get to know it well as you go. Sometimes it'll make a problem disappear too.
And welcome back to ham radio. You have a good choice of radio in an 830 and accessories.

drownut <drown@...> wrote:
I am new to the list and have been reading the mail for just a week
or so. I have a TS-830-s that I have owned since 1982 which has
seen little or no use for the past 12 years. I have recently
reactivated my interest in amateur radio and have installed a new TS
2000 station. It's OK, however, I miss the involvement of tuning up
my 830 and twisting the dials, etc. I put it on the air last week
and made a contact with a friend who said it sounded just like the
2000, if not better. However, it is a devil to tune now and seems
to have an intermittant in the mic circuit (could be the mic., MC-
160 or some unrelated problem).

I am envious of the knowledge of the list participants here and
actually am intimidated through MY lack of knowledge about our great
Kenwood hybrid gear. Be that as it may, I want to get this station
(TS-830s, SP-230, VFO-230, and AT-230) back on the air in good
order. I need a suggestion as to who I cand send the 830-s to for a
good going over (alignment, tubes, WARC enableing, etc.). The unit
looks like new and has been treated well over the years of use I
have put it through.

Any suggestions as to who might be able to bring this gem back to
full life?

Many thanks in advance,

Dave

Day off, so I thought I would look at things. With Proc turned off,
good audio output with ALC reading adjusted by mic gain. When I push
the proc button, I show deflection on the meter set to comp and the
comp level works, but no output and no ALC indication. I found what
looks like a broken connection behind the front panel ...It is the
shields of the 3 white wires to the processor switch ganged together
with the ends covered in heatshrink. It looks like it should be
connected to the rear of the Proc button but there is no evidence of a
wire having broken off there.

Anyone out there have their top cover off their 830S
>
> 73' Rick KC0HH
>

My money is on the switch itself. For some unknown reason the audio is
routed thru the switch. They didn't use dioe switching. The switches
if not regularly used tend to not make contact. Try cycling the switch
rapidly for 40-50 times and see what happens.

Not true in the case of the 6146's in the PA boxes of these radios. The driver tube is not a problem. Neutralization is eay too.

Bob:

We like to keep this as confusing as possible just so we can keep you on your toes.Hi (not really, but I know sometimes it must seem that way to you all. I'm sorry for that but we try.)

On the TS-830 there is no hole in the top of the final section. TC-1 is the capacitor that you need access to. It is pictured on the top diagram on page 31 of your instruction manual for the TS-830.

The TS-820 has a hole in the top for access. The cover must be on to do this. It makes this process miserable. Be thankful that you are neutralizing a TS-830.

Subject: [TS-520_820_530_830] 830 Neutralization

I've been running my 830S for the last couple of years, and really like this xmtr. When my transmit power went to zero recently, I found the output tubes had gone south. Not a problem; I have three sets of

matched replacements. I installed a new set of GE 6146Bs. The tubes lit up, and I was able to tune up readily into a dummy load. Now, on to the neutralization process. Or was it?

The Operating Manual says "adjust TC1, reached through the adjustment hole in the top of the final section.)" No hole in the top of the cage (assume that's what they mean by the final section.) Two holes in the side - neither appear to go to anything like what I'm looking for. Service Manual shows TC1 in the middle of the PLL Unit - bottom of the xcvr. Yup, found that small adjustable cap. Just adjacent to T7-T12. Is that the puppy I'm supposed to be cranking on?

I've read all the correspondence on this site as well as all the help files, etc etc. I can't seem to correlate the "I shrink 2 pieces of shrink tubing, (double thickness) on the screwdriver shaft so it will not touch the edges of the hole in the cover." comments with what I'm seeing. What hole? What cover? If I have the right TC1, no access problem at all. Hmmmmm.....

Sorry if this is obvious to everyone else; sometimes the "little grey cells are not working."

I use the method outlined in the ARRL Test Procedure Manual.

Basically it is the signal level that is 3db above the noise floor. It
makes for a repeatable test for direct comparision between radios.

To answer the other question about the 765. I don't remember what I
measured on the 765. I haven't seen enough of them to get a decent
sample. I do know in the Kenwood line until they came out with DSP
none of the radios would compare to the 830 for receive sensitivity.

Richard, the SP-820 doesn't go with the 830 as I recall. However there's a chance you could find one on E-Bay if you watch for a while. They're cheap to purchase. You can for the meantime use the 830 without the matching speaker as it has one built in the top cover of the unit.
Believe it or not I used to use a pve plumming elbow on my first one to refocus the sound from the top toward me. Little trick I learned from another ham who did the same thing.

Richard Fox <rfox945289@...> wrote:
I know this is probably more than a little silly to be asking but i am
fairly new. I was reciently given a TS-830S with all the accessories
except the SM-220, and was concerned all the documentation i have seen
says the matching speaker is the sp-230 but I have an SP-820? is the
sp-820 suppose to go with the TS-830 or some other kenwood rig? if
anyone would like to trade for the sp-230 i would be more then willing
to do that.

thanks for the info

Well thank You and see you on the air.

sm0wid <sm0wid@...> wrote:
Thanks to KA3DPW , WB8UHZ , K4AXF.

The rig is a TS-820 nothing else.

I modified a Leson TX-232 microphone for this purpose and hopefully it will sound good.

I have changed all tubes to original one´s, I have had the tubes at my company for a while, lucky I didn´t sell them.

I also had to change the Tx-relay, I have American Zettler brandnew 12V relay different types which fits alright.

The RF power is aprox. 120 W "all ower" according to my PM330 dummyload after retuned.

I also had to renovate the VFO plastic/metalic wheel because it was stuck, a real finemechanical work with magnifying glass, file and surgical knife.

Had no problems with selectors, switches or potentiometers.

The Rx was quit alright exept the 40m who was tuned up using my TDS-220 , SG Marconi TF2015, Counter GFC-8100, and Nordmende SRG 389 (TG).

There is also a modification with a switch to the Rx close to the MF-filters, and I´m not sure if it is for supression or something, I´ll check it out later.

At this moment the "rig" is connected to a 10m dipolantenn horizontal South to North and also a vertical AH-7000 is available.

This week, hopefully, my specialdesigned L-antenn 40by40 will be mounted up on the roof West by East if the janitor doesn´t mind.

At this moment there is a 17 element uhf antenn, 10m dipol, Comet 250 uhf/vhf, AH-7000 discone and a Avanti 800-1300 Mhz commercial antenn approximately 75 meter over the sea. I got a real nice view over the capitol of Sweden, Stockholm up on the roof. The only problem is all the cable´s, because the lenght is 40 meter down to the apartment.

I have been working with "radios" since 1974 but I waited to take my licens until my friends "pushed me" to do it. I got 12 Hours to prepare and it was easy.

I´ve got a list of "tubes used and new" out on the Internet which is
for sale real cheap. If it say´s "sålda" then it´s sold out.

Subject: [TS-520_820_530_830] Schottky Diodes UpDate

I have just completed swapping out all 16 diodes on the IF board that Gordon refers to.
One word will sum up the results. WOW!!!!
Of course this is a subjective measurement based solely on my hearing ability. Either the 20M band opened up this afterneoon or we have done something really good to this 820S.

10047. YK-88SN-1 Filter.

Yahoo group: TS-520_820_530_830 (2006)

G'day All,

just another quick question. I'm looking for a YK-88SN
for my TS-530s. I've been offered a YK-88SN-1 which I do
not recall seeing before.

I'm not sure if it will suit the 530s so can someone please advise
me if it's OK.

I'd consider any the the group may offer as well. I'm down under in
Australia so I need to consider postage as well.

Thanks and regards

Bob M. VK4HAY

Hi Bob,

The -1 suffix means it is mounted on a plug in board to install in newer Kenwoods such as TS-850, 950, 940 etc. The SSB filter itself is identical but you would have to un-solder from the mounting board to install in your 530S....The newer CW filters such as a YK-88S-1 have a different center frequency and do not work very well in the older hybrid Kenwoods. There are several YK-88SN filters for sale here on qth.com and E-Bay..They only weigh a couple of ounces so postage from the States wouldn't be more than a few dollars.

KA2NJF Walt:

That is not necessarily true. The best way is to go to 28.5 (for the 530) and tune it up on CW. Then reduce the power with the carrier control to about 75 watts. Re-peak the tune and load for maximum and observe the dip and the output. If the output peaks when the Ic is at it's dip, it should be OK. But if the dip and output peak do not coincide, the neutralization needs touching up. Slightly nudge the neutralization capacitor until you reach this condition. As I remember, the neutralization capacitor is easier to access on the 830 than the 820.

Walt,

Correct me if I am wrong but my impression was that if you are replacing old tubes with the same manufacture that you did not have to reneutralize. Is this true or not?

Bob:

We like to keep this as confusing as possible just so we can keep you on your toes.Hi (not really, but I know sometimes it must seem that way to you all. I'm sorry for that but we try.)

On the TS-830 there is no hole in the top of the final section. TC-1 is the capacitor that you need access to. It is pictured on the top diagram on page 31 of your instruction manual for the TS-830.

The TS-820 has a hole in the top for access. The cover must be on to do this. It makes this process miserable. Be thankful that you are neutralizing a TS-830.

Subject: [TS-520_820_530_830] 830 Neutralization

I've been running my 830S for the last couple of years, and really like this xmtr. When my transmit power went to zero recently, I found the output tubes had gone south. Not a problem; I have three sets of matched replacements. I installed a new set of GE 6146Bs. The tubes lit up, and I was able to tune up readily into a dummy load. Now, on to the neutralization process. Or was it?

The Operating Manual says "adjust TC1, reached through the adjustment hole in the top of the final section.)" No hole in the top of the cage (assume that's what they mean by the final section.) Two holes in the side - neither appear to go to anything like what I'm looking for. Service Manual shows TC1 in the middle of the PLL Unit - bottom of the xcvr. Yup, found that small adjustable cap. Just adjacent to T7-T12. Is that the puppy I'm supposed to be cranking on?

I've read all the correspondence on this site as well as all the help files, etc etc. I can't seem to correlate the "I shrink 2 pieces of shrink tubing, (double thickness) on the screwdriver shaft so it will not touch the edges of the hole in the cover." comments with what I'm seeing. What hole? What cover? If I have the right TC1, no access problem at all. Hmmmmm.....

Sorry if this is obvious to everyone else; sometimes the "little grey cells are not working."

My money is on the switch itself. For some unknown reason the audio is routed thru the switch. They didn't use dioe switching. The switches if not regularly used tend to not make contact. Try cycling the switch rapidly for 40-50 times and see what happens.

If your dip and output peak coincide around 28.5, don't worry about it.
If you feed the rig output into the 29 MHz scope at 28.5 SCREEN GRID OFF! It is likely that you can still see the signal. But I believe that the peak/dip method is really the most accurate.

Neutralization Update from W7DDD.

Well, with the excellent help from this group, I found the neutralization trim screw hiding beneath a wire bundle. Never called out in my Manual. So, on to the job. I checked and reset the bias and checked the driver tube per K0ZL. All OK. The xmtr tuned up just fine into a dummy load. Since my oscilloscope is only good for 20Mhz, and I don't have a sensitive RF millivoltmeter, I went down two of N9WB alternate routes.

Using a "cheap" CB SWR meter, I couldn't get any reading even with the gain knob turned up all the way. Then I installed a Swan WM-200 wattmeter and, with the SG switch ON, used the power peak/current dip method he mentions. They seemed to be bang on.

So I hooked her up and made half a dozen contacts on 40 and 20 meters. All gave me good audio reports. Power output on my Array Solutions PowerMaster Wattmeter was running 100-115 watts. I checked into my nets this morning (where they know my voice), and they said the audio was great.

Now, I've never adjusted this trim cap that I looked so hard for! I've thought of doing a neutralization using my oscilloscope down on 20 meters. But, I've also thought of 'declaring victory' and moving on.

Comments?

Rick,

I "second" Walt's comments.

The first thing I do when I start working on a Kenwood Hybrid I buy is to unplug each connector on each board, treat the connector and the pins on the board with DeOxit, and then carefully reconnect each connector. Then use DeOxit on all controls and switches including the band switch. Then at least you may be able to avoid some troubleshooting issues. What's left will usually be real problems you get to find.

Have fun.

Try Radio shack. If no results, there are other sources. Another good switch cleaner is Blue Shower available at ACE Hardware. It is not quite as good as De Oxit but will probably work. I sometimes use rubbing alcohol in a pinch.

If this does not fix the problem, remove the IF board. Look over it with a magnifying glass. Resolder any connections that look bad. Look especially around the plugs where the wires from the processor switch plug into for bad connections. When resoldering, be careful not to get solder bridges connecting traces that are not intended to be connected.

Hi Chris,

I have seen it at Radio Shack...

Well, it is not the Proc switch .... It is just going to have to annoy me for a while as I don't have time to trouble shoot the I.F. board..Thanks for all the input guys.

Hi,
Is there a common substitute for a 2SA562 transistor? Is there an
online database for semiconductor substitutes? Trying to fix a 530sp
that won't transmit.

Thanks,

Hi Barry,
I didn't try the Mod without the Resistor. I did both the Rsistor
and the 4 diodes at the same time.
According To Richard Measures (AG6K) article on Circuit Improvements
for the TS-830, he states that the lack of the resistor allows the IF
signal to Modulate the Local Ocsillator which adds some distortion.

From: james27613
Topic: 5544 Message: 10074

hi,

the D5P is in a pump spray can, so no hazmat
ups fees if you order it from mcm electronics.

the D5 is aerosol can and has hazmat fee and must
ship ground carrier.

Deoxit also comes in small 5ml bottles with a
needle applicator tip.

www.caig.com is the manufacturer.

when you are inside the radio, be sure to
clean the tx/rx relay too, just a litte deoxit
on a business card and pass the card between the
contacts, all you need to do (courtesy of Pete w2cwa).

Walt,

I replaced a set of Sylvania (ECG) 6146B's with the same and the dip an max power on my TS-830 was so close that I did not have to touch the neutralization capacitor. Now if I have to use GE 6146B's or 6146W's that is a different story.

If your dip and output peak coincide around 28.5, don't worry about it. If you feed the rig output into the 29 MHz scope at 28.5 SCREEN GRID OFF! It is likely that you can still see the signal. But I believe that the peak/dip method is really the most accurate.

Neutralization Update from W7DDD.

Well, with the excellent help from this group, I found the neutralization trim screw hiding beneath a wire bundle. Never called out in my Manual. So, on to the job. I checked and reset the bias and checked the driver tube per K0ZL. All OK. The xmtr tuned up just fine into a dummy load. Since my oscilloscope is only good for 20Mhz, and I don't have a sensitive RF millivoltmeter, I went down two of N9WB alternate routes.

Using a "cheap" CB SWR meter, I couldn't get any reading even with the gain knob turned up all the way. Then I installed a Swan WM-200 wattmeter and, with the SG switch ON, used the power peak/current dip

method he mentions. They seemed to be bang on.

So I hooked her up and made half a dozen contacts on 40 and 20 meters. All gave me good audio reports. Power output on my Array Solutions PowerMaster Wattmeter was running 100-115 watts. I checked into my nets this morning (where they know my voice), and they said the audio was great.

Now, I've never adjusted this trim cap that I looked so hard for! I've thought of doing a neutralization using my oscilloscope down on 20 meters. But, I've also thought of 'declaring victory' and moving on.

Comments?

I agree with you and Walt on that. Chris clean it first.

Bill Scurlock <k5gcw@...> wrote: Rick,

I "second" Walt's comments.

The first thing I do when I start working on a Kenwood Hybrid I buy is to unplug each connector on each board, treat the connector and the pins on the board with DeOxit, and then carefully reconnect each connector. Then use DeOxit on all controls and switches including the band switch. Then at least you may be able to avoid some troubleshooting issues. What's left will usually be real problems you get to find.

Have fun.

Subject: Re: [TS-520_820_530_830] Re: Help....Something Other Than Shottky Diodes.....

Hi Chris,

The switch checks out ok with an ohm meter but I guess its possible that it will not pass audio frequencies. The comp meter works fine and the comp level adjusts the compression. But no ALC indication and no output. If the schematic is correct, the audio signal goes from the comp level pot directly to the proc switch. I guess I am taking an 830S apart again.... Thanks

Chris HEmbree <w7cth@...> wrote: I am not sure if this has anything to do with your problem. When I picked up my 830s about a week ago. My Proc did not work,The radio was used most of the time for CW. I worked the Proc button on and off and it started to work. My problem is that it needs a good cleaning or a new switch.

Chris W7CTH

>
> My processor in the 830S I use quit working a while back.
Day off, so I thought I would look at things. With Proc turned off,
good audio output with ALC reading adjusted by mic gain. When I push
the proc button, I show deflection on the meter set to comp and the
comp level works, but no output and no ALC indication. I found what
looks like a broken connection behind the front panel ...It is the

shields of the 3 white wires to the processor switch ganged together
with the ends covered in heatshrink. It looks like it should be
connected to the rear of the Proc button but there is no evidence of a
wire having broken off there.
>
> I don't use the processor that often but it annoys me it isn't
working. I have been staring at schematics until I am cross eyed...
Anyone out there have their top cover off their 830S
>
> 73' Rick KC0HH
>

My money is on the switch itself. For some unknown reason the audio is
routed thru the switch. They didn't use dioe switching. The switches
if not regularly used tend to not make contact. Try cycling the switch
rapidly for 40-50 times and see what happens.

Thanks for the answer Rick,

I thought it was in a different package but I also thought the Freq. was a bit different. So is it easily removed from the PCB and is it easily damaged by heat etc..

Most of the ones on QTH are wanted and the one SN has been sold. the Ebay ones tend to go for a rediculous price especially when you take into consideration the exchange rate currently 74c US for $1 A.

I've also put some feelers out localy and am talking atm with a chap about a TS-830s,SP-230 and AT-200 station but I'm sure he will want way more than I can talk the Fiancial Manager into supplying Hi.

in newer Kenwoods such as TS-850, 950, 940 etc. The SSB filter
itself is identical but you would have to un-solder from the
mounting board to install in your 530S....The newer CW filters such
as a YK-88S-1 have a different center frequency and do not work very
well in the older hybrid Kenwoods. There are several YK-88SN filters
for sale here on qth.com and E-Bay..They only weigh a couple of
ounces so postage from the States wouldn't be more than a few
dollars.

Hi Barry,
We will have to wait until Walt weighs in on this Issue. I work on
many 830's but Walt is the Expert on the 820's. Even though I have
repaired a few myself, I always respect what Walt has to say.

Let's see what Walt says about the Resistor.

Yes a friend of mine from upstate Pennsylvania has his station in the living room and it contends with the TV. He came up with this idea. So I found one in our plumming parts and I got one. I'm a little off in my hearing too. It helps me alot. But I recently moved my radios to something other than horizontal and now it won't stay there. But I got an SP-230 now too.

10087. NO ALC TS830S ...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-10 23:33:22 UTC
From: Ruben Echevarria
Topic: 10087 Message: 10087

I hate to sound like a broken record but..... Ok they're CD's now, anyway ....

After reading this repost, it sounds alot like the problem that I have with my "Gold TS830S" no ALC action. I've gone over the block diagram and came across Q19 transistor on the IF Board. I haven't checked it yet but it's about the only that I haven't done. Originally I couldn't get any receive and very low RF output. I started by pulling the connectors and then reconnecting and suddenly RX came up. So I pulled the board and resoldered most of the solder points on the board. That stabilized it for the most part. But still no ALC action although at times it does deflect but then dies out. In order to get any audio deflection on meter the MIC gain has to be turned up all the way and the PROC also all the way. There is a drop with PROC off. At times when I switch over to ALC on the meter the needle just sits there, no movement. At times I get a flicker. So I'm wondering if Q19 is the culprit. By the way no changes when adjusting VR6 and VR7. So I have a road block here ..... Ruben ...KA2HHB

(This is the repost here)
My processor in the 830S I use quit working a while back.
Day off, so I thought I would look at things. With Proc turned off, good audio output with ALC reading adjusted by mic gain. When I push the proc button, I show deflection on the meter set to comp and the comp level works, but no output and no ALC indication. I found what looks like a broken connection behind the front panel ...It is the shields of the 3 white wires to the processor switch ganged together with the ends covered in heatshrink. It looks like it should be connected to the rear of the Proc button but there is no evidence of a wire having broken off there.

I don't use the processor that often but it annoys me it isn't working. I have been staring at schematics until I am cross eyed...

Gordon as I recall nad I don't have my book here with me right now, It's over at my Elmers. But it threw me off too. The radio as I recall the adjustment is on the bottom. The picture when I once did the neutralization I looked again at it because I had to figure out where the adjustment was. That was what I was referring to. The diagrams.

There is also a product called De-Ox-Id contact cleaner. Another very good contact cleaner. 2oz bottle is around $8.00. Napha is part of the ingrediant so use in well ventalated space.. Q tips and like said before, business card soaked in cleaner. I get it from Purchase Radio in Ann Arbor, Michigan.

james27613 <james27613@...> wrote: hi,

the D5P is in a pump spray can, so no hazmat
ups fees if you order it from mcm electronics.

the D5 is aerosol can and has hazmat fee and must
ship ground carrier.

Deoxit also comes in small 5ml bottles with a
needle applicator tip.

www.caig.com is the manufacturer.

when you are inside the radio, be sure to
clean the tx/rx relay too, just a litte deoxit
on a business card and pass the card between the
contacts, all you need to do (courtesy of Pete w2cwa).

Hi Ruben,

When you have the processor on, put your meter in the comp position and see if you have any deflection and if the comp level does anything. If so, you have audio at least to the I.F. board. If you look at Ken -K4EAA's web site, he has a color 830S schematic with voltage test points labeled on it. Will help in trouble shooting. My problem only occurs when the Proc is turned on....And it is not the switch.

Ruben Echevarria <ka2hhb_2000@...> wrote: I hate to sound like a broken record but..... Ok they're CD's now, anyway ....

After reading this repost, it sounds alot like the problem that I have with my "Gold TS830S" no ALC action. I've gone over the block diagram and came across Q19 transistor on the IF Board. I haven't checked it yet but it's about the only that I haven't done. Originally I couldn't get any receive and very low RF output. I started by pulling the connectors and then reconnecting and suddenly RX came up. So I pulled the board and resoldered most of the solder points on the board. That stabilized it for the most part. But still no ALC action although at times it does deflect but then dies out. In order to get any audio deflection on meter the MIC gain has to be turned up all the way and the PROC also all the way. There is a drop with PROC off. At times when I switch over to ALC on the meter the needle just sits there, no movement. At times I get a flicker. So I'm wondering if Q19 is the culprit. By the way no changes when adjusting VR6 and VR7. So I have a road block here ..... Ruben ...KA2HHB

Hello Rick .... yes I do have audio. I pick it up on my other TS830S.
And yes there is deflection when switched to COMP.
Also see upward deflection when in RF.
I'll check out Ken's site for that schematic...thanks..
I just pulled the IF board again, seems like connector #5 is erratic.
And I did a resolder recently on it. Also connector #6 was loose
resoldered that no more problems there. Prior to doing the resolder
on #6 the radio was not doing anything, basically dead.
Anyway that's the story. I'm at a loss here. Also I'm limited as far as test
equipment, only have a multimeter. Anyway I'll keep plugging away
maybe I'll get lucky and learn something in the process.

Thanks...Ruben ...KA2HHB

From: n9wb
Topic: 9995 Message: 10103

Hummm

I am looking at the balanced detector on the TS-830 and TS-820. They are quite similar. I have noted that in the TS-820 the LO is injected into the center wiper of a 1k potentiometer (VR-3). This is adjusted for minimum carrier in the IF line. When adjusting this, I have noticed that this was extremely broad and had little effect except near the ends of it's rotation.

I noted that in the TS-830, this has been replaced with two 470 ohm resistors and the LO is injected into the junction between them. This would be the same as if VR-3 in the TS-820 were exactly centered. I would be tempted to replace VR-3 with two 470 ohm 1/4 or 1/8 watt resistors. Each one would connect to the opposite ends of where VR-3 was and the other ends of these resistors would form a common point where the center of VR-3 was. Then I would add a 100 ohm 1/4 or 1/8 watt resistor from this common point to nearest ground foil as is done with the TS-830. TC-5, the trimmer capacitor would still have to be re-adjusted.

If you choose to not replace VR-3, place the 100 ohm resistor from the center of VR-3 to nearest ground. This can be done on the foil side of the board.
If you do replace VR-3 with two 470 ohm resistors, place the 100 ohm resistor from the common point between these resistors to nearest foil ground.

The reason I would be tempted to replace VR-3 is because it is my experience that these little potentiometers sometimes fail and are not extremely stable. It seems that Kenwood came to this conclusion when they designed the TS-830, one of the finest radios ever designed from all but a mechanical standpoint.

I have noted that on some TS-820, there is a bit of distortion on audio peaks like AG6K mentions. This problem was eliminated when I installed the INRAD model 88 filter in my TS-820. The model 88 has a bit more loss than the original filter because it has an extra pole. This reduction in IF signal seemed to solve the problem. But AG6K also mentions this problem and attributes it to intermodulation of the LO signal with detected audio. His 100 ohm resistor provides a load for the LO that is apparently plentiful and adds stability. So when I do all of this to my TS-820 I am going to try the 100 ohm resistor and replace VR-3 with 470 ohm resistors.

Resistors: Do not use wire wound resistors. It is unlikely that you will encounter these however. Carbon, Carbon film, and metal film are very satisfactory. Just for the sake of information, metal film are the best, however, that is way overkill. I am going to use Radio Shack Carbon Film resistors myself.

I mention these things to provide general information. I don't mean to worry you to death about trivial things. In this circuit, you will never notice the difference between metal film and carbon film. I just want you to know that metal film resistor are better.

One of my three electronic mentors was a teacher. W9VVT (SK), Earl Lemme. He taught me to teach. At least I try.

10104. Scope advise

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-11 05:42:47 UTC
From: wb9iog
Topic: 10104 Message: 10104

I'm at a crossroad with my old Tek 535A and beginning to think
in terms of a more responsive scope for digital analysis.
Cursury examination of past posts mentioned the Tek 465,465B and the
475 versions that might satisfy my need.

Any advise appreciated. Also considering equivalent manufacturers
but am a bit leery of some imported stuff.

Thanks
Mike
Iowa

10105. DG-5 or how to measure frequency of VFO

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-11 06:11:17 UTC
From: WebBoy
Topic: 10105 Message: 10105

Has anyone tried hooking up a frequency counter to the VFO phone plug output on a TS-520 to read the frequency? I tried this but got an odd reading. Is the DG-5 the only way to read this frequency. I guess what I am asking is did Kenwood code this so you have to buy the DG-5 to get a reading? Or am I doing something wrong as usual?

Thanks

Roger KC7FPB

10106. Diode mod complete

Date: 2006-10-11 13:02:29 UTC
From: max_ve3tmt
Topic: 10106 Message: 10106

Last night I completed the swap of diodes in both the modulator and detector stages. I also did the 100 ohm resistor mod in the detector. I had done a sweep of the receiver before and after the change but in my excitement I saved the new picture over the old one!! But I did see a definite difference in the receiver noise level. As far as the modulator change, the TX audio does sound a little cleaner, but conditions were very poor here last night so I couldn't get any checks on the air!

Hi Ruben,

According to the schematic Ken has on his site, Q19 on the I.F. board should have 1.5v on the base, 8.5v on collector and .9v SSB (6.1v CW) on emitter if working properly.

Rick KC0HH

Ruben Echevarria <ka2hhb_2000@...> wrote: Hello Rick .... yes I do have audio. I pick it up on my other TS830S.
And yes there is deflection when switched to COMP.
Also see upward deflection when in RF.
I'll check out Ken's site for that schematic...thanks..
I just pulled the IF board again, seems like connector #5 is erratic.
And I did a resolder recently on it. Also connector #6 was loose
resoldered that no more problems there. Prior to doing the resolder
on #6 the radio was not doing anything, basically dead.
Anyway that's the story. I'm at a loss here. Also I'm limited as far as test
equipment, only have a multimeter. Anyway I'll keep plugging away
maybe I'll get lucky and learn something in the process.

Thanks...Ruben ...KA2HHB

From: Randy Morton
Topic: 10105 Message: 10108

The DG-5 is, basically, a frequency divider (or is it multiplier, I forget) that shifts the count from the internal VFO. Changing the setting on the DG-5 changes the shift. You can do the same thing with a counter and a calculator. Set your radio on a known frequency and "playing with the numbers" a little. The formula should become evident fairly quickly.

Good Morning...Thanks Rick, I'll check out those voltages.
I just plugged the board back in and fired it up.
I was up until 2am this morming going over the board checking for cold solder joints and just redoing a few more points. Use a a jewelers magnifying glass to check the tracings and joints. Whatever looked cold I resoldered. Then did a thorough cleaning of all the connectors and the board.
Well the board is in and it looks like I'm down about 20watts now (gremlins).
The good thing is all the intermittents are gone.

Thanks...Ruben ... KA2HHB ......

10110. Re: DG-5 or how to measure frequency of VFO

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-11 15:13:26 UTC
From: Clif
Topic: 10105 Message: 10110

The DG-5 is not as you describe.

It is a frequency counter that measures the output of it's internal mixers. The DG5 requires from the radio 3 different frequencies which it mixes to determine the operating frequeny of the radio. These are Het Osc which changes with band, VFO Freq which changes within the band, and Carrier Freq which changes by mode (USB, LSB, CW). Once these components are mixed then it is fed to the counter which indicates frequency of the radio.

That is why the DG-5 is also a stand alone counter.

This is a very simplified description as it actually uses addition and subtraction of an internal 10Mhz oscillator so that no mixing products are on any oscillator frequency or the operating frequency which could cause birdies in the main radio.

Clif

Hi Ruben,

The schematic is about a 5 meg PDF file that Ken says will print up to a 36" wide paper at Kinkos or other printer service. Sure would beat looking at the schematic in the 830S owners manual with a magnifying glass. My eyes start to cross.
When you say all the intermittents are gone, ar eyou showing ALC on transmit now?

Hi Max,

Glad you received the diodes. They got there pretty quick. Easy mod with good results.

40 meters was poor early in the evening but was really quiet late. I got my 830S back together and exchanged 5/9 reports with LY2ZZ.at 05:36 UTC...Pretty late for you guys. He was the only signal I heard on 40 meters except the BBC at 7160.00... Very low noise level just no other activity at all.
Still no processor though....

Thanks for the update, Clif. I had checked into this in the past and thought that only a single signal was pulled from the external VFO plug on the 520 and that a manual band change was necessary to match the DG-5 to the radio. I must be getting the DG-5/520 combo mixed up with another set.

Ken,

The SP-230 uses three (3) RCA jacks on the rear panel. Two are for
radio 1 and radio 2. Third is a line level output jack for the active
radio.

Rick,

I appreciate the diodes. It was fairly easy to do the swap. I am
kicking myself for saving over the original noise sweep though. Now I
guess I no longer have any more reasons to open the 830 up! Time to
reap the rewards of my labour. I can't wait for conditions to improve
to the point of really giving the receiver a good listening to notice
any improvements.

Does installing the 100 ohm resistor knock the sensitivity down any?
Would recalibration of the s-meter be necessary?

HI Max,

I didn't notice any decrease in sensitivity at all. Quite the contrary actually. I did have to tweak L19 and L20 to 600mv after the 100 ohm resistor install.
Your S meter should peak at S9 with the calibrate signal. Good way to check it.
I have a jpeg of your scan after the caps change on the audio board if you want it...I think it is the same one as is on the photo section of the group.

73' Rick KC0HH

max_ve3tmt <max_ve3tmt@...> wrote:

--- I appreciate the diodes. It was fairly easy to do the swap. I am kicking myself for saving over the original noise sweep though. Now I guess I no longer have any more reasons to open the 830 up! Time to reap the rewards of my labour. I can't wait for conditions to improve to the point of really giving the receiver a good listening to notice any improvements.

Does installing the 100 ohm resistor knock the sensitivity down any?
Would recalibration of the s-meter be necessary?

Hi Chris

For RF bypass caps, the ceramics are fine but for audio circuits they will skew the frequency response. If that is all you have, then use the ceramic. I used a .0022 mylar for C106 myself.

Hi All,

Well, I tracked down an open diode on the I.F. board, replaced it and now the processor works again.

For those of you who have not visited Ken Kemski's (K4EAA) web site he has a very large format color schematic of the 830S with voltage test points labeled available for download. By large I mean it will print out a 36" wide sheet if you take the file to a Kinkos or other commercial printer. He also has a wealth of information on Kenwood hybrid radios besides being kind enough to take the time to cut and paste the various board schematics, piece them together into one large page, label voltage test ponts and make it available to all. His site is www.k4eaa.com

Rick,

Where did you measure the 600 mV? I couldn't really understand the service manual. It looks like you measure off the 2nd jumper to the right of connector #9 but not sure. The receive is still great, listening to a local on 40m here pinning my meter! I did a scan of the reciever noise with no antenna connected before the mod and then duplicated it after the diode swap. But I saved over the original. My calibrate signal peaks just under S9, but I don't have the proper tools for adjusting the coils. I may pick up a set this weekend. My VFO-230 will be here on Friday, so I will be busy painting the case to match the other gear and setting everything up. I may realign the receiver but I don't think it will make much difference. I'm glad to hear you got the processor working again. Nice thing about these radios, they are very easy to diagnose and treat.

Hi Rick.
That is Great that you located the problem. It always feels good
when you figure it out. Which Diode was it?
Also, I called Kinkos about printing out Kens Schematic to 36 inches.
The guy there said it was $10.00 a SQUARE foot. Well I thought that
would come out to $ 90 bucks, (3 X 3 = 9 Square Feet) but he said, no.
it's only $30.00 or so plus tax
Now, $30.00 seems expensive, ($90 would have been outrageous) but it
sure would be easier on the eyes. I think I will go get it done tomorrow.

Rick, You measure from pin 4 of Connector 11 and ground. (It is a
jumper from pin 3 to pin 4 I believe it is a Purple wire.
I also had to adjust L19 and L20 back down to 600mv after adding the
resistor.
It was no big deal with the scope. An rf Voltmeter would work also very
well.

Hi Max,

Th S meter adjustment is with two variable resistors. I don't have a service manual handy for the exact VR #'s, but you can use a screw driver. A flat tip tuning tool would be better though.

In AG6K's own words "The correct LO-voltage, measured across the added 100 Ohm terminating-resistor, should be approx. 600mV peak to peak on both USB and LSB. This voltage can be set by alternately adjusting L19 and L20.. This test point is also available, from the component side of the board, on pin 4 of connector #11, to circuit common." I used my Fluke with an RF probe. I didn't have to tweak them much at all.

Great on the VFO-230 ...You will enjoy it. I sure do mine...

Thanks for the info Rick. If I ever have the need to pop the case I will measure those voltages. Everything seems fine as it is. I'm excited about the VFO, although not sure why I got it. I think it was more to do with trying to get all the accessories. Had the SM220 scope years ago but traded it away. Kicking myself for that one now. Does the VFO-230 allow you to tune digitally or same as the radio itself, i.e. analogue VFO?

Max

HI Chris,

The 50 volt cap is more than enough. When I did the C106 mod, all I had on hand was a .0022 mylar so that is what I used. . It is not worth tearing into the I.F. board to swap it out for a .001...If you are going to buy one, put the .001uF in. Measures recommends that size.

There is a company in Auburn WA called Almost All Digital Electronics www.aade.com that makes a similar but smaller unit for the 520 and several others. I got one when I got tired of the DG-5 prices on e bay. It has worked well for several years now. The unit is available as a kit or assembled, I don't remember the price, but remember it was quite reasonable.

Hi Rick, No I do NOT know any civil engineers. Hey, If you can get it printed for $8.00, how about getting it printed twice. I'll buy a copy from you. They way I see it $8.00 + SHIPPING < $30.00 hi hi..
Thanks for the info on the Diode. I will keep that one noted here for future reference.
I received my next batch of 200 Diodes today. I already have standing orders for almost 100 of them. These things are going like Hot cakes. I'll be shipping this batch on Friday.
See what you started !!!! I must say though, I am impressed with the results. Thank You !!

Thank you for your input. I did locate a place that had one. Man it is getting hard to buy parts in town anymore. I have been away from replacing parts for 10 years when I became a cell site tech. and out of the radio repair business..
I will pick up the .001 this week. One Mod out of the way and 2 more to go.
Chris..

Rick KC0HH <kc0hh@...> wrote: HI Chris,

The 50 volt cap is more than enough. When I did the C106 mod, all I had on hand was a .0022 mylar so that is what I used. . It is not worth tearing into the I.F. board to swap it out for a .001...If you are going to buy one, put the .001uF in. Measures recommends that size.

73' Rick KC0HH

Chris HEmbree <w7cth@yahoo.com> wrote: Thank you.
I got on the internet and found 2 places in Boise that had .001 Mylar caps one 50v and the other 650v. The service Man. does not say what the voltage is of the .015uf that is in there now.I don't think you will need much voltage on this cap.
Is any one using anything other than the .001uf cap that they like better?

Chris.

Hi Max,

The VFO-230 is digital with 5 memories, RIT circuit, VFO Lock, and T-F Set, and has its own frequency display. The VFO-240 is the analog version with the same PTO circuit the 830S uses but uses the display readout of the 830S...I would think the 230 will work great for your digital modes.

One note about my VFO-230. I can not use the same power strip for both the radio and the VFO to turn them both on/off at the same time. The radio must have power to it first. Not necessarily turned on, but have power to the plug before I put power to the VFO, or my VFO-230 display comes up scrambled and will not work when I do turn the 830S on. I thought my VFO-230 quit working the first time it did this. I do not know if this is common, but I suspect it is. You also lose any memory stored if you unplug the VFO.

max_ve3tmt <max_ve3tmt@...> wrote: --- In TS-520_820_530_830@yahoogroups.com,

Thanks for the info Rick. If I ever have the need to pop the case I
will measure those voltages. Everything seems fine as it is. I'm
excited about the VFO, although not sure why I got it. I think it was
more to do with trying to get all the accessories. Had the SM220 scope
years ago but traded it away. Kicking myself for that one now. Does
the VFO-230 allow you to tune digitally or same as the radio itself,
i.e. analogue VFO?

Max

Hi Gordon,

Give me a couple of days to check with the Engineer's Office here. I am off Friday and will go talk to them. There are a couple of places here that have large format plotters and I will see what I can come up with. A large color coded schematic would be great.

73' Rick KC0HH

Gordon <n6wk@...> wrote:

Hi Rick, No I do NOT know any civil engineers. Hey, If you can get it printed for $8.00, how about getting it printed twice. I'll buy a copy from you. They way I see it $8.00 + SHIPPING < $30.00 hi hi..
Thanks for the info on the Diode. I will keep that one noted here for
future reference.
I received my next batch of 200 Diodes today. I already have
standing orders for almost 100 of them. These things are going like
Hot cakes. I'll be shipping this batch on Friday.
See what you started !!!! I must say though, I am impressed with
the results. Thank You !!

I do not have a good answer to that. Somebody with a calibrated signal generator needs to check the sensitivity after doing this mod. I am up to my ears in alligators right now, but I hope to do this mod to my TS-820 eventually. I have a signal generator that can check this. In the mean time, I would just use it for a while. Unless the S-meter reading seems low, I wouldn't worry about it. Of course, if a signal generator is available, it could be set. I usually set them for S-9 with 50 microvolts input.

Hey Walt,

First off let me say all your knowledge and expertise with these rigs
is greatly appreciated. Of all the groups I belong to, this group has
20 times more the activity of all the others combined and I enjoy
reading each and every post. With everything I have learned from this
group, I have turned my 830 setup into a great performing station. I
hope everybody keeps up the good work.

I had a question regarding the addition of the 100 ohm resistor to the
830. I swapped the diodes last night and added the resistor. I
adjusted L19 and L20 for max signal. Do I need to recalibrate the s-meter?

All phone priveleges are being expanded on 80 & 40m, and Generals on 15m (they will be able to work down to 21,275 KHz). On 40m, Generals will be able to use phone down to 71775 KHz, and Advanced & Extra will be able to use Phone down to 7125 KHz.

The hugest changes are on 80, where Generals will be able to go down to 3800 KHz, Advanced will be able to do Phone down to 3700 KHz, and Extras will be able to work phone all the way down to 3600 KHz. These changes will not go into effect until they are formally published in the Federal Register.

Here's the URL to the ARRL story - it lists all the changes (Including VHF, etc.):
http://www.arrl.org/news/stories/2006/10/11/100/?nc=1

From: nasa820
Topic: 9948 Message: 10157

Neutralization Update

With the help of the members of this group, I found that hiding TC1 adjustment cap, jury rigged a T connection to the dummy load feed, wrapped about 15 turns of hookup wire around the power tap, hooked up my 20Mhz scope to the coupled hookup wire, and successfully neutralized the new finals the proper way in about 1 minute. Worked like a charm and easy as pie. Now, I'm good to go kosher style!

This is a GREAT group! I belong to quite a few, and this one is by far the best. No politics. No flaming. The speed is amazing - answers sometimes within minutes. And the volume of traffic blows away most of the others, even on new sexy pieces of equipment. This Kenwood line of gear obviously has a huge and active following. I love my 830, and obviously a lot of others do too.

Thanks again!

10158. Pesky S-Meter (TS830)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-12 22:56:43 UTC
From: Hauser, Ron M.
Topic: 9948 Message: 10158

Greetings Group. I am trying to troubleshoot a weak S-Meter. The meter works, but it is not sensitive, and I've gone through the calibration procedure. There is a component somewhere on the receive side, that is weak. I get no S-meter reading at all until a solid S9 signal, then it perks up and give a reading. My question:

Can anyone direct me to the area of the radio where the received signal comes into the meter? I'm sitting here staring at the schematic and I just can't find the S-Meter circuit.

Thanks!

Ron,
Sounds like when I had an 830 that had a bad L41 Coil.
Are the receive signals weak as well as low on the S meter ?

10163. RE: [TS-520_820_530_830] Pesky S-Meter (TS830)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-13 01:32:53 UTC
From: Ron Hauser
Topic: 9948 Message: 10163

Hi Gordon... Well, I'm rather stumped, so I'll look at L41 -- I assume on the IF board?

Receive is very good, I have done A/B switching with it next to my other radio, (a TS820), and the receive on the 830 is slightly but noticeably better. But signals which come in S5 to S8 on the other radio, won't move the S-meter on this TS830. I have gone through the calibration by tweaking VR2, VR3, on the IF board, which are the "normal" calibration methods in the manual, and I can't get any sensitivity. So there has to be a component in the circuit somewhere close to the S-meter that is weak.

I've been ignoring it because it doesn't much impact my operation of the radio, but lately I have wanted to do the alignment steps in the manual, and many of them require you to peak a signal on the S-meter. So it has annoyed me enough to start tracking it down. I just don't know enough yet about the circuits around the meter to figure out where I am going.

Ron,
Sounds like when I had an 830 that had a bad L41 Coil.
Are the receive signals weak as well as low on the S meter ?

I am getting ready to do this to. My new tubes came in today. I have a 100mhz scope and a dummy load. What is the power tap that you are talking about? I have a Kenwood 520 that I can rec on at the same time I neutraliz the 830. I would like to know more on how you hooked up your scope and the t connection and wires.I have a rf probe and a meter I was going to try for fun.

Thanks
Chris.

nasa820 <nasa820@...> wrote: Neutralization Update

With the help of the members of this group, I found that hiding TC1 adjustment cap, jury rigged a T connection to the dummy load feed, wrapped about 15 turns of hookup wire around the power tap, hooked up my 20Mhz scope to the coupled hookup wire, and successfully neutralized the new finals the proper way in about 1 minute. Worked like a charm and easy as pie. Now, I'm good to go kosher style!

This is a GREAT group! I belong to quite a few, and this one is by far the best. No politics. No flaming. The speed is amazing - answers sometimes within minutes. And the volume of traffic blows away most of the others, even on new sexy pieces of equipment. This Kenwood line of gear obviously has a huge and active following. I love my 830, and obviously a lot of others do too.

Thanks again!

Your S meter should read about S9 with the calibrate signal peaked. Best to check this on a dummy load or a dead band so you don't get any AGC action. Mine is a needle width below S9 when peaked and it is calibrated for 50uV for S9 signal.

From: Ruben Echevarria
Topic: 10167 Message: 10167

In ''refarming' ' the frequencies currently authorized to Novice and
Technician Plus licensees,

The Commission increased the voice segments for General, Advanced
and Amateur Extra licensees.

On 75 meters, Generals will be able to use voice from 3800-4000 kHz,
an increase of 50 kHz.

Advanced class licensees will be able to use
voice from 3700-4000, an increase of 75 kHz,

Amateur Extras will be able to use voice from 3600 to 4000 kHz,
a generous increase of 150 kHz.

On 40 meters, Advanced and Extra Class licensees will be able to use
voice from 7125-7300 kHz, an increase of 25 kHz.

General class licensees will be able to use voice on 7175-7300 kHz, an increase of
50 kHz.

On 15 meters, General class operators will have phone privileges on
21275-21450 kHz, an increase of 25 kHz.

To become official once they are published by the Commission.

Greetings Group. I am trying to troubleshoot a weak S-Meter. The meter
works, but it is not sensitive, and I've gone through the calibration
procedure. There is a component somewhere on the receive side, that is
weak. I get no S-meter reading at all until a solid S9 signal, then it
perks up and give a reading. My question:

Can anyone direct me to the area of the radio where the received signal
comes into the meter? I'm sitting here staring at the schematic and I just
can't find the S-Meter circuit.

Thanks!

Both my 530s and 830s have an "unlit" digit on the far right hand side of the display. You can shine a flashlight into the digital display to the far right, and see what appears to be an unlit digit in both of them. Instead of reading 3973.0 why doesn't it say 3973.00?

It seems like I had a 430s one time that there was a say to turn that last digit off or on.

Hi Ron,

The S meter is active on receive obviously, and switches to transmit via the T/R relays...I wonder if you have dirty/corroded points and need to clean your relays. Any resistance thru the relay contact points would knock the S meter down. I would do that first before I started pulling boards out to check. I will send you another snip of Ken's schematic directly showing the S meter path.

Well this certainly deserves some investigation. A few years ago I
acquired a mint FT107 station, except some of the segments in the
transceiver frequency display were starting to dim. So I built a new
display usning yellow LED's but at the same time I included a 10 Hz
LED that I wire to show as zero all the time. Although the digit
wasn't functional, it did make the readout look more modern. I am
going to look through the schematics of the 830 and see if this digit
can be turned on. I didnt think there was room in the front display to
see another digit. Can't verify, I'm at work!

The TS-530 (and probably the 830) uses an LSI counter IC (Toshiba TC5070P) for the frequency counter and this only caters for six digits.

A data sheet for this IC can be found at www.alldatasheet.co.kr

Rick,
That is Excellent. Please drop me an email off list with the total
cost including the tube and postage and I will get the cash to you ASAP.

Thank You VERY VERY much.
73,
Gordon

I researched the driver IC and indeed it does only have outputs for 6
digits. Now if the display in the 830 has 7, perhaps it can be lit
another way?? Any ideas?

Chris,

The easiest thing to do with your test equipment is to connect a coax TEE on the output of your radio, connect the dummy load to one side of the TEE fitting, and connect your scope lead to the other side of the TEE fitting. This lets your scope look at the voltage across the dummy load. For the scope connection I have a BNC adapter that allows me to connect the scope leads to individual connections that come out of the adapter. This is more dependable than using a separate receiver which sometimes picks up stray RF and confuses things. You can also use an RF Probe connected to the TEE and feed that signal to a sensitive Meter rather than using the scope. Or, you can stick in another TEE and feed both the scope and the RF Probe w/meter at the same time and see comparison readings. Have fun.

Subject: Re: [TS-520_820_530_830] Re: 830 Neutralization

I am getting ready to do this to. My new tubes came in today. I have a 100mhz
scope and a dummy load. What is the power tap that you are talking about?
I have a Kenwood 520 that I can rec on at the same time I neutraliz the 830.
I would like to know more on how you hooked up your scope and the t connection and wires.I
have a rf probe and a meter I was going to try for fun.

Thanks
Chris.

nasa820 <nasa820@...> wrote: Neutralization Update

With the help of the members of this group, I found that hiding TC1
adjustment cap, jury rigged a T connection to the dummy load feed,
wrapped about 15 turns of hookup wire around the power tap, hooked up
my 20Mhz scope to the coupled hookup wire, and successfully
neutralized the new finals the proper way in about 1 minute. Worked
like a charm and easy as pie. Now, I'm good to go kosher style!

This is a GREAT group! I belong to quite a few, and this one is by
far the best. No politics. No flaming. The speed is amazing -
answers sometimes within minutes. And the volume of traffic blows
away most of the others, even on new sexy pieces of equipment. This
Kenwood line of gear obviously has a huge and active following. I
love my 830, and obviously a lot of others do too.

Thanks again!

Hi Max

I remember when the TS-430S came out it had a 6 digit display, but you could go in and snip a resistor and come up with the 7th digit. I am not sure of the counter IC used in the 430S or if it could be modified for use in the 830S, but it would be interesting to investigate.

Topic: 10167 Message: 10181

Very interesting about the 7125 allocation for voice. As a mostly CW operator, I often start my session at the rig with an afternoon visit to 7110, the CW QRP calling freq. If 7110 is quiet, I will call CQ at 6 to 8 WPM hoping for a novice to respond. This happens more than naught. I really like to help out new CW operators, wether novice or higher, it makes no differance. That pretty much leaves the slow operator 25 VS 50 kc's to make a connection. Granted, between 7125 and 7150 is heavy with Broadcast, I suppose it will be a challange for SSB as well as it was for the CW operator. I probably have made and or heard no more than a dozen contacts over the last 15 years between 25 and 50. My 2 cents, Rich

Ruben Echevarria <ka2hhb_2000@...> wrote: In ''refarming' ' the frequencies currently authorized to Novice and
Technician Plus licensees,

The Commission increased the voice segments for General, Advanced
and Amateur Extra licensees.

On 75 meters, Generals will be able to use voice from 3800-4000 kHz,
an increase of 50 kHz.

Advanced class licensees will be able to use
voice from 3700-4000, an increase of 75 kHz,

Amateur Extras will be able to use voice from 3600 to 4000 kHz,
a generous increase of 150 kHz.

On 40 meters, Advanced and Extra Class licensees will be able to use
voice from 7125-7300 kHz, an increase of 25 kHz.

General class licensees will be able to use voice on 7175-7300 kHz, an increase of
50 kHz.

On 15 meters, General class operators will have phone privileges on
21275-21450 kHz, an increase of 25 kHz.

To become official once they are published by the Commission.

Hooked the VFO up. With the recieve button set to VFO, turning ext VFO knob does nothing but change the frequency on the display. The receive frequency does not change on the 830. Regardless of which FUNCTION switch is depressed the MAIN LED on the top stays lit. If I select VFO function for either TX or RX the VFO LED will light up but the MAIN LED stays lit up. I think this is overriding the EXT VFO operation. Am I doing something wrong?

Max

It looks like a factory made cable. Molded connectors on each end. I see it only fits into end jack one way so it isnt twisted in any way. I'm just wondering if I am missing something. The previous owner said it was working fine with his rig.

Another thing too...the RIT control changes nothing. All the switches are working. If I dial up 14.200 and hit the memory in on the 230, it will sotre the frequency and recall it when the recall button is pressed, but it is not doing anything to the 830. I dont think the MAIN and VFO LED's are supposed to be on at the same time.

Max,

First, check your cables on the back. Mine were like that when I first attached to my 830. My connector wasn't in the socket on the back of the 830.

Second, I found sometimes if I stopped the power to the vfo for a moment while the 830 stayed on the VFO would reset. There are 3 places on the back that cable may fit. Make sure the cable is in the correct one.

I have verified the cable is in the socket closest to the edge of the radio.

When I plug the cable in I hear a relay click in the VFO and the display comes to life.

Lets say my 830 is on 14.200.0 If I hit MEM in on the EXT VFO it stores the frequency because pushing the memory out changes the EXT VFO's display to show the new frequency stored, but the 830 still acts like there is no EXT VFO hooked up.

When I put the EXT VFO in VFO mode on both TX and RX, both the MAIN & VFO LED's on the EXT VFO are lit, this doesn't sound right. I would think only the VFO LED should be lit. Can someone put their VFO in VFO mode and tell me if the MAIN LED goes out. I think this may be the source of my problem, as if the main VFO of the radio is always overriding the EXT VFO.

Assuming everything was working okay, does the readout on the 830 ever change with the EXT VFO being changed or do you treat them as independent displays? I've never used an external VFO with these rigs so I'm not sure.

No Max if you set the buttons to the remote VFO to recieve you should be able to see the change on the display of the 830 (assuming the digital hold is turned off).
Did you try the reset I spoke of. Sometimes it clears things out. Beyond that the cable might be your culprit like Gordon said. You could try cleaning the sockets and cables to see if that brings a resolution. You may even clean the inside boards and connectors and such. Try swapping a cable.

stores the frequency because pushing the memory out changes the EXT
VFO's display to show the new frequency stored, but the 830 still acts
like there is no EXT VFO hooked up.

When I put the EXT VFO in VFO mode on both TX and RX, both the MAIN &
VFO LED's on the EXT VFO are lit, this doesn't sound right. I would
think only the VFO LED should be lit. Can someone put their VFO in VFO
mode and tell me if the MAIN LED goes out. I think this may be the
source of my problem, as if the main VFO of the radio is always
overriding the EXT VFO.

Assuming everything was working okay, does the readout on the 830 ever
change with the EXT VFO being changed or do you treat them as
independent displays? I've never used an external VFO with these rigs
so I'm not sure.

Do you Yahoo!?

Now you see why we work together. That's what gets the job done. What one may not know, another might. What one experiences can relate to another and someone else may know something more. It's the next best thing to having all the knowledge and experience yourself, only to become more so yourself in the end.
Enjoy. See you on the air.

nasa820 <nasa820@...> wrote:
Neutralization Update

With the help of the members of this group, I found that hiding TC1 adjustment cap, jury rigged a T connection to the dummy load feed, wrapped about 15 turns of hookup wire around the power tap, hooked up my 20Mhz scope to the coupled hookup wire, and successfully neutralized the new finals the proper way in about 1 minute. Worked like a charm and easy as pie. Now, I'm good to go kosher style!

This is a GREAT group! I belong to quite a few, and this one is by far the best. No politics. No flaming. The speed is amazing - answers sometimes within minutes. And the volume of traffic blows away most of the others, even on new sexy pieces of equipment. This Kenwood line of gear obviously has a huge and active following. I love my 830, and obviously a lot of others do too.

Problem solved!

I thought I would check the switch on the EXT VFO jack on the 830. I was getting 9V on the VFO control line regardless of the cable in the jack or not. I unsoldered the wire going from the switch to the VFO control pin and voila it works. The switch is shorted!

Max, I am pretty sure you treat them as Independant VFO's
That being said, when you have the External VFO on and in RX mode, you should be able to tune across the band and hear signals using the External VFO. If you switch to Transmit, The external VFO will be displaying your Transmit Frequency only.

I have a VFO 240 so I really can't answer your questions exactly.

Hi Rich,

I ve been doing QRP since the mid 80s. Actually 7110 is only the QRP calling freq. for Novice, and Tech w/HF Priveleges operators. The main 40m QRP calling freq. in North America, is 7040, and there are plans to move it down to 7030, to bring it in line with the rest of the world (whihc uses 7030 for a QRP calling freq.).

If 7110 is quiet, I will call CQ at 6 to 8 WPM hoping for a novice to respond. This happens more than naught. I really like to help out new CW operators, wether novice or higher, it makes no differance. That pretty much leaves the slow operator 25 VS 50 kc's to make a connection. Granted, between 7125 and 7150 is heavy with Broadcast, I suppose it will be a challange for SSB as well as it was for the CW operator. I probably have made and or heard no more than a dozen contacts over the last 15 years between 25 and 50. My 2 cents, Rich

Oh yes Ellen, you are also right on about 7040. I have a homebrew rock bound transmit 3 watt tranciever I built several years ago and all I have are 7009, 7025 and 7110 and 7124. The VFO works from 7000 to 7200. 7110 can get some nice DX QRP at times and of course 7130 but that has some horrible broadcast QRM most of the time here. My TR4 and the TS530 can idle down on CW to 5 watts no problem too. Hope to work you someday. Rich KG7FS

From: John Harp
Topic: 9948 Message: 10199

Ok Chris, what was described was to use a dummy load attached to the 830 like an antenna. With that 5other 520 you may listen on the same frequency for a null in the noise while your listening to it. That's one way.

Another way is to put in line an RF volt-meter. Look for a dip. It's gotta be sensitive.like millivolts or microvolts. Thats another way.

Now I've used a field strength meter and a number of turns of small wire around that short section of transmission line that attaches the 830 to the antenna dummy load. I take and attach that to the antenna of the FSM. Maybe wrap it around that or plug it into the FSM's socket. Remember, we are not hooking it up direct, only wrapping it around the the plastic coated shield on the outside to catch a small sample of the signal. This acts like a pickup coil and the sample is delivered to the meter or an oscilloscope as in your case and you can see the defection of the meter or read the signal on your display. You can look for a change in the signal. A dip in amplitude or the neter needle will drop back no lower.

Now remember Chris. When you do this you need to be set to the frequency of about 28.5 mhz. Some may say another similar frequency like 28.8. I found that works for me too. What ever your manual says for that radio; use it.

The book speaks of an SG Switch on the back. Use that setting to neutralize the Finals. When your done return that SG Switch to the normal operation setting the manual states. This is important. If you don't you'll look at your display and think it's broke the next time you turn it on. You won't hear a sound. If such is the case, Don't panic just turn it off and set the switch.

Now, here's the point you will turn to control the neutralization. On the bottom side of the PA box there is a printed circuit board. It has the sockets for the tubes soldered to it. look at the pictures in your manual if your not sure. On the bottom of that board is a little trimmer cap. It looks like a set screw adjustment. To access it you must take off the bottom cover and locate that board I described. The book marks it as TC1. It may seem a little hidden behind some wires near the edge of the board. Look at the manual to make sure you have that correct component. That little TC1 will balance the 6146 pair electrically.

Don't forget to set the SG Switch when you are done.

Follow what the book says and you'll do fine as the rest of us have. If you neutralize it correctly, you'll like the results of the process. If it doesn't seem to work as well you'd expected, you can go back and neutralize again. It's no big deal.

Keep an extra set of tubes as a back up.

Many people believe you need matched pairs of tubes. You don't really need to. It's just easier to neutralize tubes that are closely matched.

That's the basics of the procedure for you Chris. Don't forget the information is also in our archives should you need it.

Chris HEmbree <w7cth@...> wrote:
I am getting ready to do this to. My new tubes came in today. I have a 100mhz scope and a dummy load. What is the power tap that you are talking about?
I have a Kenwood 520 that I can rec on at the same time I neutraliz the 830.
I would like to know more on how you hooked up your scope and the t connection and wires.I have a rf probe and a meter I was going to try for fun.

Thanks
Chris.

I was talking to Gordon N6WK. He told me that I can take a T and hook one side of the scope to it.with a dummy load.Do I need to tune the radio for that Freq as If I was going to talk first.?
Chris..

John Harp <ka3dpw@yahoo.com> wrote: Ok Chris, what was described was to use a dummy load attached to the 830 like an antenna. With that 5other 520 you may listen on the same frequency for a null in the noise while your listening to it. That's one way.

Another way is to put in line an RF volt-meter. Look for a dip. It's gotta be sensitive.like millivolts or microvolts. Thats another way.

Now I've used a field strength meter and a number of turns of small wire around that short section of transmission line that attaches the 830 to the antenna dummy load. I take and attach that to the antenna of the FSM. Maybe wrap it around that or plug it into the FSM's socket. Remember, we are not hooking it up direct, only wrapping it around the the plastic coated shield on the outside to catch a small sample of the signal. This acts like a pickup coil and the sample is delivered to the meter or an oscilloscope as in your case and you can see the defection of the meter or read the signal on your display. You can look for a change in the signal. A dip in amplitude or the neter needle will drop back no lower.

Now remember Chris. When you do this you need to be set to the frequency of about 28.5 mhz. Some may say another similar frequency like 28.8. I found that works for me too. What ever your manual says for that radio; use it.

The book speaks of an SG Switch on the back. Use that setting to neutralize the Finals. When your done return that SG Switch to the normal operation setting the manual states. This is important. If you don't you'll look at your display and think it's broke the next time you turn it on. You won't hear a sound. If such is the case, Don't panic just turn it off and set the switch.

Now, here's the point you will turn to control the neutralization. On the bottom side of the PA box there is a printed circuit board. It has the sockets for the tubes soldered to it. look at the pictures in your manual if your not sure. On the bottom of that board is a little trimmer cap. It looks like a set screw adjustment. To access it you must take off the bottom cover and locate that board I described. The book marks it as TC1. It may seem a little hidden behind some wires near the edge of the board. Look at the manual to make sure you have that correct component. That little TC1 will balance the 6146 pair electrically.

Don't forget to set the SG Switch when you are done.

Follow what the book says and you'll do fine as the rest of us have. If you neutralize it correctly, you'll like the results of the process. If it doesn't seem to work as well you'd expected, you can go back and neutralize again. It's no big deal.

Keep an extra set of tubes as a back up.

Many people believe you need matched pairs of tubes. You don't really need to. It's just easier to neutralize tubes that are closely matched.

That's the basics of the procedure for you Chris. Don't forget the information is also in our archives should you need it.

Chris HEmbree <w7cth@yahoo.com> wrote:
I am getting ready to do this to. My new tubes came in today. I have a 100mhz scope and a dummy load. What is the power tap that you are talking about?
I have a Kenwood 520 that I can rec on at the same time I neutraliz the 830.
I would like to know more on how you hooked up your scope and the t connection and wires.I have a rf probe and a meter I was going to try for fun.

Thanks
Chris.

nasa820 <nasa820@...> wrote: Neutralization Update

With the help of the members of this group, I found that hiding TC1 adjustment cap, jury rigged a T connection to the dummy load feed, wrapped about 15 turns of hookup wire around the power tap, hooked up my 20Mhz scope to the coupled hookup wire, and successfully neutralized the new finals the proper way in about 1 minute. Worked like a charm and easy as pie. Now, I'm good to go kosher style!

This is a GREAT group! I belong to quite a few, and this one is by far the best. No politics. No flaming. The speed is amazing - answers sometimes within minutes. And the volume of traffic blows away most of the others, even on new sexy pieces of equipment. This Kenwood line of gear obviously has a huge and active following. I love my 830, and obviously a lot of others do too.

Thanks again!

Bill Scurlock <k5gcw@...> wrote: Chris,

The easiest thing to do with your test equipment is to connect a coax TEE on the output of your radio, connect the dummy load to one side of the TEE fitting, and connect your scope lead to the other side of the TEE fitting. This lets your scope look at the voltage across the dummy load. For the scope connection I have a BNC adapter that allows me to connect the scope leads to individual connections that come out of the adapter. This is more dependable than using a separate receiver which sometimes picks up stray RF and confuses things. You can also use an RF Probe connected to the TEE and feed that signal to a sensitive Meter rather than using the scope. Or, you can stick in another TEE and feed both the scope and the RF Probe w/meter at the same time and see comparison readings. Have fun.

Yes chris,
Before hooking up the TEE, you would tune the rig as normal on
28.500 or 28.800 (either one works just fine)into a Dummy Load.
Then you would flip the SG switch to OFF, install the TEE and hook
up your Scope. Adjust for a Minimum signal when placing the sitch in
SEND without a Key installed on CW.

Hi Max,

Went to a movie with my wife.....

Ok on the shorted switch ..It is supposed to short when the VFO cable is removed. Replaces the external plug required on the 820(S)... But it should open when you plug the remote VFO cable in. Check your Acc jack and see if the NO / Common line is shorted all the time. This is used as the keying line for an amplifier. You may have a 'welded' set of contacts points on the aux relay in the 830S used to key Acc jack.

Does the 230 work now as it should? When you push the VFO button on the 230, the 830S will assume the readout of the 230 and with the main button pushed, the VFO will track the 830S readout.

73' Rick KC0HH

max_ve3tmt <max_ve3tmt@...> wrote: Problem solved!

I thought I would check the switch on the EXT VFO jack on the 830. I
was getting 9V on the VFO control line regardless of the cable in the
jack or not. I unsoldered the wire going from the switch to the VFO
control pin and voila it works. The switch is shorted!

Hey Rick,

My wife is out of town til Sunday so I have lots of time to play
radio. I isolated the switch and measured the contacts with the plug
in and out. Dead short either way. When I plug the cable into the
remote jack (radio off of course) you can definitely feel that switch
working. No tension at all in the VFO jack switch. So as long as I
leave the VFO plugged into the radio all is well. I took the VFO
apart, gave it a nice scrub and proceeded to paint the cabinet the
gunmetal color to match the rest of the gear. Looks really nice. Very
glad to have it working.

Now, just to find an SM220 with pan adaptor!!

From: n9wb
Topic: 10187 Message: 10214

I am guessing that the meter is not reading correctly. On the rectifier unit, There is a tap labeled HV. This is the output to the HV meter. R-5 R-6 and R-7 are 680 K ohms each and form a series resistance totaling 2,040 K ohms or 2.04 meg ohms. R-8 is a 100 k ohm resistor to ground. This provides a voltage divider and provides the multimeter with the correct current and voltage to reflect the high voltage present at the tap 800.

I suspect that R-8 has increased in value and is causing your HV meter to read incorrectly. I would purchase new resistors for r-5 through R-8 and replace them. If after doing this, the meter still reads high, please let us know.

> Both my 530s and 830s have an "unlit" digit on the far right hand
side of the display. You can shine a flashlight into the digital
display to the far right, and see what appears to be an unlit digit in
both of them. Instead of reading 3973.0 why doesn't it say 3973.00?
>
> It seems like I had a 430s one time that there was a say to turn
that last digit off or on.
> W0DLR

Well this certainly deserves some investigation. A few years ago I
acquired a mint FT107 station, except some of the segments in the
transceiver frequency display were starting to dim. So I built a new
display usning yellow LED's but at the same time I included a 10 Hz
LED that I wire to show as zero all the time. Although the digit
wasn't functional, it did make the readout look more modern. I am
going to look through the schematics of the 830 and see if this digit
can be turned on. I didnt think there was room in the front display to
see another digit. Can't verify, I'm at work!

Shhhh don't tell the boss!

Hi Gordon,

May I have one set of the matched Schottky Diodes? If it is suitable
for TS 520S, please let me know about the amount IOU. I'll send to
you by mail.

With best regards, de Harry VE3LCW.

10218. The oscillators are driving me crazy!!!!!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-14 16:39:11 UTC
From: max_ve3tmt
Topic: 10218 Message: 10218

I assume the receive noise should be somewhat similar sounding when switching between USB and LSB. One minute mine sounds fine, then the next the USB is very low and the LSB is very high. I go in and readjust the trimmers for the oscillaotrs and set it to normal and it is good for a bit, but then goes out again. Is it possible the trimmers are shot? What would cause both to go out?

TC2 and TC3 adjust the oscillators and VR2 or VR3 adjust the carrier points on TX. When the receive goes funny it is also affecting my TX signal. In USB mode my signal is very bassy and in LSB it is very tinny.

Help please, I am really getting tired of taking the covers off!

Hi Rich,

Sure, it'd be great to QSO with you. 40 is kind of nuts, besides we may be too close for 40m, so we may have to do it on 30 or 20m. Let me know if you'd like to QSO, and when, and on what freq.?

73,

The SM220 works quite nicely with the TS830. If it has the BS8
panadaptor built in it will work as a band scope with the 830.

Hi Max,

If you wiggle your IF Shift knob does the audio change pitch? I wonder if it is dirty. Of course that would not affect the transmit. I doubt if both ceramic caps could be bad. Dirty VR2 would not affect receive either. Weird isn't it....

I would not adjust my oscillators by comparing white noise on either sideband.
It is probably late enough for you to listen to a AM broadcast station and switch back and forth between USB and LSB..They should sound identical. The station should be within a couple of hertz of being on frequency. Find the BBC or CBS..Something you know. I wouldn't trust Radio Somalia....

Look at Rich Measures', AG6K, article about Circuit Improvement and Maintenence. At the very end of the article concerning Maintenence he goes through aligning the carrier oscillators using the calibrate signal....
Another way to do it is if you have a signal generator, and transmit tones thru to set your passbands

73' Rick KC0HH
.

Topic: 10230 Message: 10230

I was at the Springfield, Mo hamfest today, I saw a nice 520s for $250 obo, a 530s for $325 and an 830s for $375. None of the three sold, however, I did hang around the table with the 530s and 830s and met several fellows that had nothing but praise for these radios. I saw a nice TL922 for $750. didnt sell.

One gent had been an AM station engineer, and said he had owned both a 530s and 830s, and should have never parted with them.

Its apparent that anyone that has one, loves it, and anyone that has parted with one in the past knows he made a mistake. Just my .02 cents worth. Hope everyone has a good weekend, its been super beautiful here in the Ozarks.

I gave everything a good cleaning today and so far so good. I think the oscillator trimmers may have been dirty. I need to invest in a good frequency counter! I'll check out Rich's article, but for now I'm not opening it up again. I strung up an 80m longwire this evening and am sitting here copying 40 over signals and watching the NASCAR race.

That's ok Chris I'd rather hear a dumb thing this way than something more serious. Glad to help what I can.

Go with Gordons way if you have the resources. Sometimes in life I have to makeshift since somethings aren't available to me.

Gordons probably a little more knowledgeable than me sometimes. We all work together to provide someone like you the best we can give. I at times didn't have a scope or a second radio or a sensitive VTVM. All I had was no money and a cheap CB/SWR meter with a FSM in it. Then I got the job done with that.

Right now I don't have my manual here to make sure my answer is correct. As I recall the neutralization process requires no adjustments of the 830. moving the SG Switch seems to set the 830 in another mode for the process.

Chris HEmbree <w7cth@yahoo.com> wrote:

Thank You Gordon. I couldn't remember.

Gordon <n6wk@...> wrote: Yes chris,
Before hooking up the TEE, you would tune the rig as normal on
28.500 or 28.800 (either one works just fine)into a Dummy Load.
Then you would flip the SG switch to OFF, install the TEE and hook
up your Scope. Adjust for a Minimum signal when placing the sitch in
SEND without a Key installed on CW.

Date: 2006-10-15 04:40:58 UTC
From: jsloss
Topic: 10234 Message: 10234

Have installed the Schottky diode mod and the addition of a 100 ohm 1/4W between R-75 and R-76 and ground in the IF unit. Using a Fluke DVM and RF probe I measure about .002 V across the 100 ohm resistor. Tweaking L19 and L20 does not seem to have much effect except to lower audio. Am trying for the 600 mv level per Measures mods. Would someone care to walk me thru it.

Thanks
Joe k7mks

Hi Max.

I see I'm getting in on this subject a little late, but if you haven't solved the problem already, you might check the 9V supply stability. I think I remember listening to the receiver frequency changing as I adjusted the 9V set point on my radio. This may or may not cause the symptoms you are experiencing. Good Luck.

Subject: [TS-520_820_530_830] The oscillators are driving me crazy!!!!!

I assume the receive noise should be somewhat similar sounding when
switching between USB and LSB. One minute mine sounds fine, then the
next the USB is very low and the LSB is very high. I go in and
readjust the trimmers for the oscillaotrs and set it to normal and it
is good for a bit, but then goes out again. Is it possible the
trimmers are shot? What would cause both to go out?

TC2 and TC3 adjust the oscillators and VR2 or VR3 adjust the carrier
points on TX. When the receive goes funny it is also affecting my TX
signal. In USB mode my signal is very bassy and in LSB it is very tinny.

Help please, I am really getting tired of taking the covers off!

Max

Hi Bill,

I checked and adjusted bot the 9V and 3.6V voltages on the AF unit. I
cleaned all the trimmers and pots today and so far it is behaving
normally. I think the xtal trimmers TC2 and TC3 on the PLL board were
dirty. Thanks for the suggestion.

Max

The fluke will not read RF ACV. You need an RF probe or a scope.

However, I am not sure that I agree that L-19 and L-20 should be detuned for 600 MV. I would try peaking them for maximum receive audio. I doubt that doing so will cause a problem with the new diodes and the 100 ohm resistor installed, but if it does, I would be tempted to lower the value of the 100 ohm resistor instead.

Gordon, do you or Max have any comment on this?

Probably you lost your tubes. You likely opened or damaged R-2 and R-3 on the final board. R-2 and R-3 are connected in parallel in series with the cathode and are 10 ohm 1 watt each for a parallel value of 5 ohms. Use only a 1 watt resistor here, no larger or smaller wattage. Do not use wire wound. Carbon, carbon film or metal film are OK.

I personally like the ECG Phillips tubes that RF parts sells.

Be sure you replace the fuse with the correct value. You might want to make a light bulb tester for your initial tests. See Save your transformer in the files section of this group.

You will need to neutralize after installing the new tubes.

I got lucky about 20 years ago. I picked up a 4 channel 100mhz scope. Scope works like new even now.
Chris..

John Harp <ka3dpw@...> wrote: That's ok Chris I'd rather hear a dumb thing this way than something more serious. Glad to help what I can.

Go with Gordons way if you have the resources. Sometimes in life I have to makeshift since somethings aren't available to me.

Gordons probably a little more knowledgeable than me sometimes. We all work together to provide someone like you the best we can give. I at times didn't have a scope or a second radio or a sensitive VTVM. All I had was no money and a cheap CB/SWR meter with a FSM in it. Then I got the job done with that.

Right now I don't have my manual here to make sure my answer is correct. As I recall the neutralization process requires no adjustments of the 830. moving the SG Switch seems to set the 830 in another mode for the process.

After I performed the Product detector Diode Mod, I found that by
peaking L19 and L20 gave me approximently 900mv accross the Resistor.
The radio appeared to work just fine by Peaking these coils. However, I
was following the Mod article exactly, So I alternately adjusted L19
and L20 with my Scope to get 600mv PEAK to PEAK from Pin 4 of
connector-11 to Ground.
Joe, Do you have the Fluke set to read AC volts ??

That is strange Joe. You should be reading around .600 AC volts with your RF probe. I used a scope, but still, a DVM with an RF probe should work just fine also. I just remembered, If you have an RF probe, I do believe you must have your Meter in DC to read it.

10246. Re: [TS-520_820_530_830] Re: 1n5711 Schottky Diodes, noise reduction and signal to noise ratio

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-15 17:09:50 UTC
From: Dave and Loraine
Topic: 10246 Message: 10246

Hi all,
I've just taken some measurements of audio voltages rather than RF, because it's easier and audio
is what we hear.
Standard conditions: Un-modified TS-820S, RF max, AF "2"=9 o'clock, Drive peaked, AGC off, freq. 14.3MHz, inverted V dipole, 18h00 local,
scope voltage taken across 50 ohm resistor across Phones socket.

Results
Dummy load: 0.05V
Sky noise: 0.4V
Weak signal: 0.4V

No-signal sky noise is 8x my receiver noise.
SSB weak signal is 8x my receiver noise. (+18 dB?)

If this seems unusual, maybe someone can measure their voltages under similar conditions.
If normal, it seems that sky noise and weak signals will swamp receiver noise.

I've always considered my receiver audio to be noisy.
I was all set to do the Inrad RF and IF mosfets swap and maybe the diodes swap.
I'm sure the radio would be quieter but sky noise will still be there.
Maybe I should leave well alone...
Any thoughts or measurements would be appreciated.

From: digs4ruff
Topic: 10247 Message: 10247

Well I finally have the TS-510 in my shop and have the covers off doing some cleanup and painting. Over all the rig is in not bad shape with some dirt and rust on the covers and chassis.

One of the diode rectifiers in the PS has been replaced. The originals are SE-05's and the replacement is a 1N4004. When I look both of these up on NTEs cross reference I get NTE116 as the cross reference. Can I assume that the 1N4004 is a substitute for the SE-05? All diodes check good with the Ohmeter but am wondering if the SE-05s should be replaced while the PS is dismantled.

On checking the PS electrolytic capacitors with a Heathkit C-3 which is calibrated using new electrolytics the PS 47uf caps are reading about 35uf and the 100uf caps are reading about 55uf. No leaks or shorts. Are these still considered serviceable or would I need to use a scope to read the amount of ripple to judge if they need replacing. I don't have a scope so could I use an AC voltmeter across the cap to measure the ripple.

Just the first of many questions but hopefully with adequate photos and records I may help the next lucky person to acquire one of these fine rigs.

TIA
Barry

Dave,

I discussed this same question and situation with one of the people who do Kenwood repairs. He said the same thing - that atmospheric/sky noise will more than cover up the internal radio noise. He has never considered it necessary to replace the 1N60 diodes. I did not make any "before & after" measurements so I don't know what I achieved. But, I did change out the balanced modulator and product detector diodes in two 830's and one 530, and I am happy with the results even though I have no documentation as to what I achieved. I'm going to be considering the same change in a TS-520 in a few weeks, and I am going to try to figure out a way to evaluate the results before I do it. Thanks for sharing your measurements.

10249. TS 520 no tx

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-15 18:52:43 UTC
From: PERRY
Topic: 10249 Message: 10249

Hello

I have a TS 520, No TX,-- I can inject a signal (8.615 mhz) at Point TIF. on the RF unit that comes from the IF filter board. and The Transmitter works OK
Going back to the IF filter board.. AT Q2 the vfo mixer using an ocilloscope at the Gates of this transistor My VFO gives me about 2.4 v p-p.. The Car sig (3.395) I only have about .5 v P-P. My guess this is too low...
I go to the Car input point on the Filter IF bd. I get over 2 v pp but the other side of the first transformer T1 it drops a lot..
Q1 on the filter bd boosts it back up before C18 that goes to TP1 then its .5 again..
Not sure if the VFO and the Car signals need to be about the same level at the Gates of the VFO mixer Q2 for it to work or not ?
This is the point I loose the TX (i think)
I have the Level Diagram of the service manual PG 10, just not sure what the levels of the two are at this point.

Perry,
Check R9 and R10 on the rectifier Board. One is probably open. Most likely R10
I'd like to be of more help, But I have a Terrible copy of the 520 Schematic.

I just noticed something here. I have two different schematics that are
labeled 520 right from a scan out of the manual.
One shows R9 and R10 on the rectifier board to feed the STB circuit.

The other does NOT show these Resistors on the Rectifier Board. It shows
them some where between the rectifier Board and the AF board and they
are labeled R16 and R17. In both cases they are 100k Resistors.
I'm confused now !!

73,
Gordon

Thanks Gordon
The rectifier bd only has 8 resistors.
I have all the voltages
and are correct value
My Schematic are on PDF files and are not too bad
it I resize them.
Just a pain to work with

Hi Perry, Yes I have conflicting Schematics here. You need to look for
R16 and R17. Looks like they are somewhere between boards.
They come off the 210A circuit and are beetween it and the STB terminal
on the AF board.

Sorry for the confusion.

Yeah see that much I didn't know about you. I used to own one, but I moved so much for so many years now, until recently. Now I'm settled a little longer and can have a station more like I want.
I learned to improvise due to circumstances. That's why I passed on my meter trick to you. As long as you can tell the voltage drop for the neutralization that's what counts. I've done that way too. I just didn't wanna see you plug in the radio to the scope directly if you didn't know how. That's what I was concerned about.
You know it is, you let the smoke out and the thing doesn't want to work anymore.;)

Chris HEmbree <w7cth@...> wrote:
I got lucky about 20 years ago. I picked up a 4 channel 100mhz scope. Scope works like new even now.
Chris..

John Harp <ka3dpw@...> wrote: That's ok Chris I'd rather hear a dumb thing this way than something more serious. Glad to help what I can.

Go with Gordons way if you have the resources. Sometimes in life I have to makeshift since somethings aren't available to me.

Gordons probably a little more knowledgeable than me sometimes. We all work together to provide someone like you the best we can give. I at times didn't have a scope or a second radio or a sensitive VTVM. All I had was no money and a cheap CB/SWR meter with a FSM in it. Then I got the job done with that.

Right now I don't have my manual here to make sure my answer is correct. As I recall the neutralization process requires no adjustments of the 830. moving the SG Switch seems to set the 830 in another mode for the process.

Chris HEmbree <w7cth@...> wrote:
I have one more thing to ask. Does the radio need to be tuned up first load, plate and drive. on 28.500 befor you Neutraliz. as if you were going to talk to someone on that freq. I feel like I ask the dumbest things..
Chris..

Greetings to all,

I'm currently using a dynamic mic that runs through a Behringer VX2000 voice processor and then through a PEQ-2200 5 band parametric EQ. I think it sounds okay but just can't seem to get it right and honestly I'm getting tired of knob twiddling! With the groups vast experience, please suggest alternatives, except for the MC50 which I had and really wasn't pleased with the sound. Perhaps a D104 or Shure 444? Please e-mail me off board with your experiences good and bad.

Max VE3TMT

My thought is run it for a while and think about it. See how you feel after experiencing your results.

Dave and Loraine <dave.crooks@...> wrote: Hi all,
I've just taken some measurements of audio voltages rather than RF, because it's easier and audio
is what we hear.
Standard conditions: Un-modified TS-820S, RF max, AF "2"=9 o'clock, Drive peaked, AGC off, freq. 14.3MHz, inverted V dipole, 18h00 local,
scope voltage taken across 50 ohm resistor across Phones socket.

Results
Dummy load: 0.05V
Sky noise: 0.4V
Weak signal: 0.4V

No-signal sky noise is 8x my receiver noise.
SSB weak signal is 8x my receiver noise. (+18 dB?)

If this seems unusual, maybe someone can measure their voltages under similar conditions.
If normal, it seems that sky noise and weak signals will swamp receiver noise.

I've always considered my receiver audio to be noisy.
I was all set to do the Inrad RF and IF mosfets swap and maybe the diodes swap.
I'm sure the radio would be quieter but sky noise will still be there.
Maybe I should leave well alone...
Any thoughts or measurements would be appreciated.

I just picked up a Heil Gold line GM5. I have not been on the air that much with it to give you a good report. I am not running any EQ stuff at all. If you start using a D104 make sure it has a op-amp built in it.

Chris.

Gordon & Perry.

I've been following along in the search for the 100K resistors, and that is confusing. I even have conflicts within the same Operating Manual, and my Service Manual is different from the Operating Manual. They all refer to the same board number X43-1090-00, but I guess they moved R9 and R10 to an "off-board" location and renamed them R16 and R17. I'll look at my 520 when I have time and see which arrangement mine is.

My TS-520 is s/n 341679, and the Operating Manual that came with it is identified as "6432 Printed in Japan B50-1102-00 (G)". The main schematic on the back page shows R9 connected from STB to GND, R10 connected from STB to 210A, and these resistors are shown as being mounted on the board. However, on p.36 Fig. 23 it shows the Rectifier Unit board layout and shows a photo, and neither one show the resistors R9 or R10, or even an STB terminal. Obviously changes were being made and the documentation did not keep up.

The Service Manual "copy" that came with my rig is identified as "1974-3 Printed in Japan B51-0258-00 (G)", and it shows the two 100K resistors renamed R16 and R17, and drawn on the schematic immediately above the Meter Switch S1 at the bottom of the drawing. Also, these are listed as separate parts not mounted on a board.

There are probably more of these discrepancies hidden for us to find. When you find out where these resistors are actually located Perry, please let us know.

73, Bill, K5GCW

Hi Max,

I once asked an older op the same question. He said as long as its a high impedance mic like a crystal mic. It should work ok. He had a D-104 on his 520SE and I remember it sounded good. He sugested a shure 444 or an AstaticD-104 mic.
I went loking for one on ebay and got my transverter instead.

I was just down there before coming back here and saw one ready for the kenwood on bid down there. Check it out. There reasonable in price and they do sound goods on the Kernwoods. Thats my recomendation and sometime soon will get one.

I have a D-104 you can have for $30.oo shipped to you. It has no mike plug on it, does not have the slider hold down band but it works. It is probably a 5 on a scale of 10. Let me know if you want it. I came with a used TR4C I purchsed off of QRZ. Good luck, Rich KG7FS

Hi Barry,

Hi Barry,

I don't see why you couldn't use an AC voltmeter to check for ripple. The caps that would concern me, would be the 100 uF caps. 55 uF - that's a lot of drop. More than likely, they're drying out, and may give you a fair amount of ripple. While you're at it, check out the finals. If I remember right, like the TS-900 (and my Swan 270B for that matter), they're sweep tubes. Sweep tubes can last a long time if they were taken good care of. But all too often, sweep tubes were not. They don't take abuse too well. They may be shot.

73,
Ellen - AF9J

From: Ron Hauser
Topic: 9948 Message: 10263

Hi Rick, thanks for pointing me to Q11 and Q12 on the IF board... I had "almost" figured out that is where I want to look.

First I checked the TX/RX relay contacts, and gave them a cleaning with a piece of paper and some Deoxit. It was looking very bright and shiny when I opened it up, and I did not get a change in behavior.

Next I checked voltages around Q11, Q12. The supply to R73 and Q11 is 8.98v (ok). The three leads of Q12 are 0v (ok), 4.24v (4.3v specified as nominal) 4.87v (4.8v specified). That seems pretty close. The two leads of Q11 were 5.92v (5.7v specified), and 1.12v (2.9v specified). That seems to be a problem.

I also checked the resistors around VR2, VR3. I pulled R72, R73, R74 off the board but all checked out within tolerance. Interesting note, the schematic has an error, it has R92 as a typo for R72, that was a nice bit of confusion.

I'm thinking that I'm onto something with the values around Q11 but now I'm back to poring over the schematic trying to decide where to go next.

BTW, When I go through the calibrate procedure for the S meter I never get more than S4 as the biggest peak on the calibrator signal.

Thanks for the help, and any more ideas will be welcome!

Your S meter should read about S9 with the calibrate signal peaked. Best to check this on a dummy load or a dead band so you don't get any AGC action. Mine is a needle width below S9 when peaked and it is calibrated for 50uV for S9 signal.

Hi David. I just happened to see that you are in my same call area, actually in the same state. With all the talk about getting some Kenwood QSO nets or roundtables together, I'd expect that you and I could probably make contact easy on low bands this winter. Could be a good chance to try some Kenwood 80m or 160m QSOs!

10265. 830 IF Board mods

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-16 03:42:34 UTC
From: jsloss
Topic: 10265 Message: 10265

I notice the the IF board from a 830 with 3 million+ S/N has several disc ceramics and two resistors soldered to the trace side. A IF board from a 830 with S/N in the 1M range does not have these added parts.

Does anyone have any info, from Kenwood or other sources, about these additional added components. I ask as my 830 is the lower S/N and perhaps these added components are ones I should consider adding.

Thank you,

Joe k7mks

Thanks. The finals are S2001 tubes and may well be the originals. Under power the heaters glow and there is no arcing but have not tried TX, was simply checking for dead tubes and PS voltages. Voltages with a DVM are all on except as I recall the HV is about 900V.

TVM. I did power up the rig, no TX attempt, and all tube heaters glowed including the finals. They are S2001's and may be the originals. There was no arcing yet but will reserve judgement until the TX switch is flipped. All voltages from the PS are good except the HV which is about 900V but will have to look into that a bit further.

10270. Re: [TS-520_820_530_830] Re: 1n5711 Schottky Diodes, noise reduction and signal to noise ratio

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-16 07:24:47 UTC
From: n9wb
Topic: 10246 Message: 10270

I'd do the diode swap and forget the mosfet swap.

To really tell anything about the s/n ratio, you need a signal generator with a calibrated attenuator. But I am not sure that I would worry about it.

The TS-820 has a lot of shot noise that can be heard when connected to a dummy load. You will notice that some of this noise reduces if you detune the drive control thus eliminating the noise generated by the first RF stage. (this is just a test, you cannot transmit this way) It is normal that the S/n ratio is very bad with the RF attenuator on. I find reducing the RF gain control instead of using the attenuator helps somewhat.

A lot of this is phase noise from the PLL. This is typical of PLL rigs, particularly early ones. A lot of it is that the rig is single conversion and the RF and IF FETs operate at a very high gain. As I remember from years ago, part of the mod was to change some gate resistors on the IF FET's and I found that this reduced the noise by reducing the sensitivity, in my opinion, a bad trade off. There also were some back to back diodes added, and these increased intermodulation between strong signals on receive so I removed them.

I did this mod to a TS-820 I had many years ago and I did not believe that I could tell any major improvement in the shot noise that you are experiencing.

The mosfet swap uses FETs the equivalent to NTE222, or 3N204. The 3N201 is not as good of a FET as the 3N204.

Perhaps there are better FETs today than the NTE222. I have seen some that were flat discs the diameter of the 3SK41 that could be mounted flush to the board and the leads bent down and through the holes. These may have just been an early surface mount type, however.

I have little faith that we are going to find any major magic from a FET change.

The TS-820 uses a 3SK35 in the RF front end and a 3SK41 in the IF stages. With some rigs that use the 3SK41, an increase in sensitivity has been noted by changing the front end 3SK41 to a 3SK35 or an NTE 222. However, the people that made this change reported that they did NOT note a similar improvement by changing the mixers or IF FETs from 3SK41 to 3SK35 or NTE 222. Generally rigs that use a 3SK41 in the front end do not have quite as much sensitivity as those using the 3SK35.

If we could somehow drive the FET's with more signal level and reduce the system gain, we might be able to improve the S/N ratio, but this would be difficult and would reduce the dynamic linear range thus worsening the intercept point figures.

I understand that even though the TS-830 is PLL that it is quieter. I also understand that the TS-520 is quieter because it is not PLL.

I am doing this from memory and have some information on this mod coming.

It would be interesting to know if there is a FET superior to the 3N204 available today.

Again, I would recommend doing the diode mod. Ten Tec went to Schottkys in their later rigs before DDS.

Subject: Re: [TS-520_820_530_830] Re: 1n5711 Schottky Diodes, noise reduction and signal to noise ratio

My thought is run it for a while and think about it. See how you feel after experiencing your results.

Dave and Loraine <dave.crooks@...> wrote: Hi all,
I've just taken some measurements of audio voltages rather than RF, because it's easier and audio
is what we hear.
Standard conditions: Un-modified TS-820S, RF max, AF "2"=9 o'clock, Drive peaked, AGC off, freq. 14.3MHz, inverted V dipole, 18h00 local,
scope voltage taken across 50 ohm resistor across Phones socket.

Results
Dummy load: 0.05V
Sky noise: 0.4V
Weak signal: 0.4V

No-signal sky noise is 8x my receiver noise.
SSB weak signal is 8x my receiver noise. (+18 dB?)

If this seems unusual, maybe someone can measure their voltages under similar conditions.
If normal, it seems that sky noise and weak signals will swamp receiver noise.

I've always considered my receiver audio to be noisy.
I was all set to do the Inrad RF and IF mosfets swap and maybe the diodes swap.
I'm sure the radio would be quieter but sky noise will still be there.
Maybe I should leave well alone...
Any thoughts or measurements would be appreciated.

10271. RE: [TS-520_820_530_830] 820 Keyed the mic and meter went full scale

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-16 07:42:00 UTC
From: Richard Harris
Topic: 10239 Message: 10271

Max,

The display on the 530 (and I assume the 830) is multiplexed a digit-at-a-time at a rate that is high enough so that the display appears continuously illuminated to the eye. I don't think that you could easily modify the circuit to use an extra digit.

You could arrange to switch in an extra divide-by-ten counter so that the digits moved one place to the left and the right-hand digit then reads tens of hertz. However, you would need to ensure that the various crystal oscillators were set precisely to their correct frequencies because there is little point in having a 10Hz readout if the oscillators are only set to within, say, 20Hz.... Above 7MHz you will lose the left hand digit and the decimal points will be the wrong place but you will have a 10Hz read-out.

The caps came from DigiKey. Part No. P7448-ND. If they don't have them Part No P7449-ND is the same thing. I got this informtion from a person on this list, however, I have lost his original email. After the caps arrived I deleted the original email. These replacements are 100uf 500 volt, however, they are physically smaller than the ones that are in there now. You will have to devise a way to take up the room for the chassis clamp to hold them. I used a piece of pipe insulation to put around them.

I thought I sent a response last night but, if you would like, I have a D-104 that you can have for $30.00 shipped to you . On a scale of 1-10, it is a five. It has no mike plug on it. It has a coiled cord, I would reccomend changing it to a flat one. I got it from a QRZ purchase of a TR4 awhile ago. The guy was a smoker but you can clean it up and repaint the base to make it look good. If you do not want it, I would be glad to offer it to anyone else. It is surplus to me. I use a D-104 and a 444 on my 520 and 530. I can send photo's if you would like. Good luck, Rich KG7FS

10278. TS-570S(G) vs TS-830

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-16 13:16:00 UTC
From: Ken Gunton
Topic: 10247 Message: 10278

This is NOT a scientific study, and is not published
as such --

I recently purchased a new TS570S(G), and had occasion
this weekend to put it up against my 830S.

I was operating in the PA QSO Party, and initially
used the TS570 because it integrates so well with
contest logging programs. I do like the computer
control.

About an hour into the contest, I noticed that the
570 seemed to be affected a lot by strong signals
close to the passband. I was on 40 meter phone, and
there were PLENTY of strong signals. In fact, I
had trouble making contacts within 5-6 KHz of strong
signals, because they would pull down the AGC. Using
the attenuator helped, but also degraded the signal
I was trying to copy. So did reducing the RF gain.

Sooooo..... I turned on the 830S, and by playing
with the various controls could pull in signals
which were unreadable by the 570. I did this a
number of times, and every single time was able
to copy with the 830 a signal I could NOT copy
reliably with the 570.

The 570 has only factory stock filters in it, and
the 830 has factory plus a narrow CW filter installed.

Ya gotta love them 830s!!! I had several people during
the contest remark that my 830's audio sounded outstanding.
I use a Heil Proset 5 headset. No one happened to mention
anything when I was using the 570 with the same Heil set.

Now, umm, how do I get my 830 to report frequency, etc.
to my logging program? hi hi

Just my experience. YMMV.

Remember, Microwave Update is THIS COMING WEEKEND here
in Dayton.

Hi Rich,

Yes I saw the offer, thanks very much. I am going to play around with
what I have for a bit, I think I I just need to play with the settings
a bit. I have it set pretty good now, I wish I was home during the day
to have a QSO with someone to get a report. My job keeps getting in
the way!

Max (and no, I'm not talking to myself), I use a D-104 and get good audio reports. It's what I started with when I got my 530s last spring, and have stuck with it. You know what they say: "If it ain't broke, don't fix it!"

And I know what you mean about knob-twiddling. I bought a Timewave ANC-4 and an outboard DSP unit (a competitor to Timewave, whose name I don't remember) to try to help the S/N. They're so much trouble, I generally just leave them off.

Barry, if they're S2001 tubes, you should be OK. Those are no different than the OE tubes put in the 520, 820, 530, and 830 series. In other words, they're 6146B type tubes. Give 'em the same check out and treatment you would with the tubes in you 830S.

I'll try to remember to listen tonite around 5:30 on or about 3950 +/- qrm, nets, etc. and see if we can get a few folks together. I have no idea what frequencies might be available then. Seems like lots of nets start up around 5 to 6pm. Anyone interested give a listen.

The S2001 is the Japanese equivalent to the 6146B. They were OE in the
520/820 series. The OE tubes in the 530/830 were 6146B's.

Actually the S2001 is a better tube than the 6146B IMHO. I have never
seen a pair if 6146B's in a 520/820 make as much power as the OE S2001's.

Hi Max,

You do not need to swap the four pin mic jack out on the 830S to get B+ for an electret. Just pull the mic audio line off of pin 1 of the mic jack inside the radio and feed it back thru pin 1 with a 1-2uF tantulum cap. Connect 9vdc thru a 4.7k resistor directly to pin 1 of the mic jack... The capacitor isolates the audio circuit from the 9v. Depending on which electret you use, you can keep the B+ superimposed on the audio line in the mic with the 2 wire verson of the electret. If you use the 3 wire version electret with separate audio, B+, and ground then use another tantalum in the mic to isolate the B+ and audio. Works slick...unless you plug a dynamic mic into this mic jack without a capacitor in the audio line to isolate the element...

At about 1400 UTC on Sunday the 15th I was very surprised to hear all the CW activity between 7125 and 7150. CW is not dead, in my opinion it is a sleeping giant. Ask anyone who runs DXpeditions. Funny, a lot of us want the distant and hard to get QSL but you will notice almost all DXpeditions have a CW opt. I can get a QSL via CW with my meger 100 watts and wire antenna if I am patient. Try that on SSB with all the bleed over from the mega stations. Just my opinion. Rich KG7FS

10292. Increased sensitivity

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-17 00:47:24 UTC
From: Valued Customer
Topic: 10292 Message: 10292

Has anyone tried this mod?

I'm thinking about doing this, but wanted to get an opinion or two
before venturing in. Oh, and the 10k resistor I have is a 1/4W.
Would that do?

Meanwhile, the mod text says:

1. Increased sensitivity.

On the RF board, Q5 is the RF RX amp. Notice that G2 is tied to the
AGC line.
Bend G2 up from the socket, solder a 10k resistor to it and connect
the other end of the resistor to the 9v line on the front of the
board. This will allow the FET to run wide open, and you will have a
better S/N ratio. You will gain about two S units in signal and you
may want to adjust your S meter to compensate. I did this mod almost a
year ago and have had no problems even with signals that were 40db over!

TVM but now I am getting confused. This happens a lot as age creeps up.

The TS-510 has S2001 tubes which as I find on Google search are equivalent to 6146/6146A.

The TS-820S has S2001A tubes which I understand are equivalent to 6146B/6146W.

Are these all inter changeable or not. Getting really confused.
Which way is North.
regards
Barry

10295. Schottky Diodes

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-17 05:10:15 UTC
From: Gordon
Topic: 9980 Message: 10295

Ok, All my 400 Diodes have been sold and shipped. The last matched 4 are going out tomorrow to KG7FS, Rich.
Thanks to everyone that showed interest in these Diodes. It was fun yet daunting to match them all. I did this at NO profit to myself and hope that I have helped many others aquire the Schottky Diodes they needed.
Thanks to everyone that Ordered .
73,
Gordon

Topic: 10292 Message: 10296

I have not tried this but it might be worth a try. Just do it so it can be returned to original if you do not like it.

I am not sure that more sensitivity is beneficial. What this will do is increase the output from the first RF amplifier because it will no longer be controlled by the AGC. By driving the next stages harder, the signal/ noise ratio will be a bit better only if you reduce the RF gain to the same sensitivity that you had with full RF gain before the mod. This will not make any improvement when using the RF attenuator. It will cause the rig to be more likely to overload with strong signals and perhaps hear cross modulation and images. This may or may not be a problem depending how high of an RF environment you are in.

A 1/4 watt or even an 1/8 watt resistor should be satisfactory as the current will be very low.

I am personally skeptical of such mods and I usually avoid them. This will degrade the intercept point and dynamics of the receiver so it will be a trade off. The reduction in noise will be to slightly reduce the noise that you hear with the rig connected to a dummy load. As far as the increase in sensitivity, increased sensitivity will only be of benefit on 10 and perhaps 15 meters. On other bands, the atmospheric noise is greater than the receiver shot noise so the extra gain will amplify the signal and the atmospheric noise equally. The S/n ratio will remain the same.

If increasing sensitivity beyond .4 uV or so would make weak signals be heard better, Many people would be into FET pre amps big time. But with AM (SSB is a form of AM) once the signal is into the atmospheric noise it cannot be brought out because amplifying what is coming into the rig will amplify the noise and signal equally thus the S/n ratio will remain the same.

This is why Television antenna pre amps are mounted on the antenna. These do not improve the S/n ratio at the antenna but do raise the complex signal level so it will remain above noise gained in the feedline. In other words, it makes up for the feedline loss as though the TV set were at the antenna. A TV picture is AM.

With FM, Limiters in the receiver remove the AM component. Since noise is AM, striping the AM component will improve the S/n ratio so a preamp on the back of a FM rig can recover the S/n ratio. If we tried to use a limiter on SSB, we would strip the signal as well as the noise so we cannot do this.

So I guess what I am saying is that once you have .5 or .4 uv sensitivity, more sensitivity gains nothing.

The more I think about and write this, the more I become discouraged with this mod.

The diode mod that we have been discussing may give you an improvement. Besides the diodes having a bit less shot noise, they produce less intermodulation and harmonic distortion. When noise pulses intermodulate or harmonize, they create additional noise pulses so the noise spectrum becomes more dense. The improved diodes will slightly help pull weak signals

out of the muck because your demodulator will not be generating additional muck.

"Muck".... a new term to go in the glossery of the ARRL handbook Hi.

Subject: [TS-520_820_530_830] Increased sensitivity

Has anyone tried this mod?

I'm thinking about doing this, but wanted to get an opinion or two
before venturing in. Oh, and the 10k resistor I have is a 1/4W.
Would that do?

Meanwhile, the mod text says:

1. Increased sensitivity.

On the RF board, Q5 is the RF RX amp. Notice that G2 is tied to the
AGC line.
Bend G2 up from the socket, solder a 10k resistor to it and connect
the other end of the resistor to the 9v line on the front of the
board. This will allow the FET to run wide open, and you will have a
better S/N ratio. You will gain about two S units in signal and you
may want to adjust your S meter to compensate. I did this mod almost a
year ago and have had no problems even with signals that were 40db over!

If you are wanting to improve your rig, the diode mod will give you cleaner receive and clearer transmit. the improvement won't be earth shaking, but will do more good than the FET gate modification.

Hi Chris,

Great! Sounds like you need a new project now..Hi I was going to tell not to throw the old tubes away, but for $34.50 for a set of new tubes, they probably are not worth keeping. I am working nights this week so any HF schedule will have to be Friday or Saturday night...

Dace,
I think Spam is just a lurking dragon. I am getting all kinds of returned Mail, That I never sent. Someone overseas is sending all this spam for the PK stocks and spoofing the header to make it appear that it is coming from n6wk.com
I called my ISP, and unfortunately, there is Nothing I can about it. They verified that no one hacked into my site to send the mail.
I am going to have to learn how to read an email header to figure out where the mails are originating so I can file a complaint with that provide..
Very Frustrating. I feel your pain !

Dave: I am getting lots of junk from people pretending to be from ebay. If you get bogus ebay email you can forward it to spoof@... unfortunately I think they do little to stop it. I get between 20 to 40 pieces of junk mail a day. I don't open, delete it and delete the delete file. You also need to go into Microsoft Outlook (if you use that as I do) and delete the deleted-deleted files they store in options (it is at the bottom page of options). Nothing is simple anymore. Rich

I frequent 43 Yahoo lists and rarely receive spam email associated with these groups. Once every month or so one sneaks in.

Setting your email preferences at Yahoo to accept offers etc. will generate junk, so perhaps that's what's happening. You might want to check that.

Afternoon Barry,

Sorry about that. You are right, the S2001A tubes were used in the TS-820 & TS-520. So you're using a variation of the 6146A - hmmmmmm. You still have a final amplifier tube, BUT there's a good chance that it may NOT be interchangeable with the more common 6146B. The biasing is different for the two tubes, and sometimes you can end up with parasitic oscillations if you use the 6146B in place of the 6146A. If you look in the group's Files section, the word document about the 6146 family of tubes, provides additional info on this family of tubes. Good luck on getting your TS-510 going. I wouldn't mind getting my hands on a TS-900. Like your 510, it's a unique rig. Let us know how it goes, and if you're looking for an on-the-air test QSO, I'll be more than happy to oblige you.

It is Walt,

It is the earliest Models I'm aware of, that was marketed internationally under the Kenwood or Trio name. Previously, the only Kenwoods that were imported to North America, were a few transmitters, receivers, and VHF rigs, that were imported by Lafayette Electronics under their brand name. Not many were imported to North America. The 510, was also capable of doing AM.

Gorden,

Just returned home from a trip and if I remember correctly. I had some large prints made at Staples and the were way cheaper them the price quoted to you by Kinko's. The prints were as large or larger then the 36" print you are talking about. Try staples or maybe you can get one of the Technical high school to print it for you. That is if they have plotters that large.

Hi Rick.
That is Great that you located the problem. It always feels good when you figure it out. Which Diode was it?
Also, I called Kinkos about printing out Kens Schematic to 36 inches. The guy there said it was $10.00 a SQUARE foot. Well I thought that would come out to $ 90 bucks, (3 X 3 = 9 Square Feet) but he said, no. it's only $30.00 or so plus tax
Now, $30.00 seems expensive, ($90 would have been outrageous) but it sure would be easier on the eyes. I think I will go get it done tomorrow.

73,
Gordon

You will never get rid of it. Once it starts it will never get better.
Make yourself a new email address for this group and never use your email for anything other than this group. Yahoo is bad on spam if you use your email for other things.
Chris..

Don't forget the TS-511 and TS-900. Trio also made equipment sold under the Allied name. All of Lafayette's "famous" late 50's and early to mid 60's receivers (amateur and general coverage) were made by Trio. Lafayette's two transmitter models were made in the U. S. Trio also made several of Lafayette's amateur VHF transceivers.

I meant to say S2001A. I don't have anything on the TS510 so don't know what is in it. The TS-511 used 6LQ6's.

David,

If I understand you correctly, you say you are getting SPAM from the Drake list? As one of the other posters has pointed out, spammers will spoof emails in a heartbeat.

I work for the NC Attorney General's Office. About 3 months ago, we switched our email system and my email address changed. We have some of the heaviest filtering you can imagine and spam still gets through. Not only that, it has not taken the spammers long to start spoofing my new work email address. I am regularly getting bounced messages returned to me that I never sent.

One excellent thing about this group is that the moderators have to physically approve all members. On lists that do not require moderator approval to join, you will get a ton of spam. I do not moderate or belong to any group that does not require moderator approval for that reason alone. A spammer can spoof the list email all he or she wants, and it will never get to the group!

Just to give this some relevance to radio, I am thoroughly enjoying reading about all the mods and restorations being discussed lately, not to mention learning a great deal in the process!

Ooops! Sorry Pete!

I meant that not many TS-510s were imported into the US. Sorry I wasn't clearer. Yeah I know that Trio/Kenwood was one of the main suppliers for Lafayette (I'd forgtten about Allied). I think the TS-510 predates the TS-900. I wish I could get my hands on a TS-900, I think they look cool, and if they're anything like the T-599, they probably do decent AM.

10329. TS530 is blowing fuses

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-18 02:26:08 UTC
From: Rich Jones
Topic: 10329 Message: 10329

On CW ten meters this evening, local ground plane and USB also local ground plane. Started to blow a fuse, not only on CW but USB. I always use the tune method, dip plate, peak grid,etc. Never had a problem until tonight. I am moving tghe shack around. The manual tuner is grounded but not the rig. Of course the outher coax transfers a good earth ground directly outside the shack. I even blow a fuse at 40 watts out?? Sounds like a bias problem or a bad final? Any recommendations?

Hello all,

I am new to the group and I am lucky enough to own a ts 520. I actually have almost a complete station, that includes the 520, the at200 tuner, the sp520 speaker, the vfo 520, the TS 520, mc50 mic and a pc1a phone patch. I purchased it off another Ham who was downsizing. Any way I have a couple of questions.

Could I connect a keyer to this radio so I can use an iambic paddle? If so is there a specific model I should get.

And when should I think about replacing the tubes, I don't know if the tubes in the radio are original.

Thanks all
Chris

Thanks Walt,

Well this morning I think that it gave it up. :) Got up this morning and turned on the radio and was just listening on 80 meters and all or a sudden there was a series of loud 'pops'. No smoke or fried smell. I shut it off. Looking inside I found that the cathode resistors were both open. Checked R5 and R6 on the final board and one of them ohmed out at 125 ohms. Replaced both of them and the cathode resistors R2 and R3. While I was in there replacing those I found a ceramic cap - one of the .047uf ones and it had flamed and was charred on the top - may be where the smoke came from??

While I'm in here I'm changing out the three resistors R5, R6 and R7 on the high voltage board.

Do you know what the value of C3 is? Looks like .047uf - do you know what voltage?

Thanks for all your help.

If you are asking about C-3 on the Final board, this is .047 uf at 100 v. You should also replace C-4 that is the same thing. changing out R-5,6,and 7 on the HV board is a good idea.

I am concerned, however. You may have shorted tubes. You are cruising for a needlessly blown transformer. Look up the article "save your transformer" and build a light bulb tester. Please take my advice on this and do not operate the rig any more until you have it in line. Transformers are very expensive and very hard to get.

Hi Chris,

Welcome to the group. Regarding the keyer, you can use an external keyer with a set of paddles but if the 520 is like the 830, there is -65V on the key line. You will need to put some kind of interface in there, unless the keyer will work with the older rigs. I believe some of the MFJ units will do both.

What are the tubes in there now? Have you looked at them? What kind of output are you getting from them? You may not need to change them for a long time yet.

Max VE3TMT (Kingston)

Max is right. You need to make sure your keyer can handle -65 VDC keying voltage from the rig. My keyer (Idiom) required that I swap a jumper inside the unit to switch from positive to negative keying voltage.

Many of the MFJ keyers are similar. They have outputs for either solid state (positive) or grid block (negative) keying but you need to change one or more jumpers inside to make the switch.

If you want your keyer to be able to handle either with no internal changes then you'll probably need an external "thing" to do that. There is one made, a solid-state relay. I believe it is sold through Morse Express (MorseX.com) and may be made by Island? I think it's something like $20 or so. I don't have web access at the moment or I'd have looked it up for ya!

Personally, I would look for a 599 A or D pair. Then at least you don't have to keep lifting the top cover of the transmitter to diddle with the some of the controls. My D pair sound great on AM.

George,

Looking at the schematic, it does appear that the unused antennas are
switched to ground. I have uploaded the manual into the files section
under "Manuals"

If you google Kenwood TS520D you will almost always find the sites are in Japanese and refer to the product as TRIO. More than likely the Japanese version of the S. A friend of mine has an Icom 760, he bought it in Japan when he was there and it is virtually a 761. Maybe the same with the Kenwood TS520D? I am sure you will get lots of replies. Good luck, Rich

David check that transformer. Go back in the archives and find the procedure for save that transformer. You'll use the 100 watt light bulb to act as a ballast to check the transformer. Find out if it is any good.
I hope it is for you. Because they aren't cheap. I got lucky and someone had one in the group.
For example and this one won't fit yours, but to buy one for my radio off the store shelf I found was just a little over 127 US dollars. They're a hard to find item. From now on protect your radios. Come back and tell the group your results.

From: w6hv
Topic: 10345 Message: 10345

I just changed out the four diodes in the product detector, added the 100 ohm resistor, and also changed C-106 on the IF board. Turned on the rig and no audio! There is voltage across the resistor as viewed on a 'scope. However, the meter pegs full right and I hear the relay on the AF/AV board engage. I checked and found no crimped wires, pulled connectors or bridged solder joints. So, don't know what this old man did wrong, but any suggestions would be appreciated before I have to go through the entire rig.

Troy, W6HV

Greetings and welcome to the group. Wish you well with the 520. What's it's wattage out put been like. Tell us that first.
As for the keying there are two basic types of keying. Your 520's manual tells you which type of keying you will need to use. Most keyers are capable of both types of keying. Most tube gear goes with the one type of keying and solid state generally goes with the other.
As the messages come to greet you someone will probably have an answer for you. I own TS-830 and my name is John.

Troy,

First thing I would do is go back through all the connectors, making sure they are plugged into the proper mating connector. I write the connector number on the molex end as I remove them. Check for any you may have missed when you plugged them back in. I had no signal once and saw I forgot to plug the small coax cable back in at the rear. Did you notice any loose board side connectors when you removed the cables? I found quite a few on my IF board and a couple even came off with the wire. I made a point to resolder all the pins back on the board. I do this whenever I remove a board. Check to make sure all the diodes were put in the proper way. Make sure your RF gain isn't all the way down. I'm sure you checked all my suggestions but it's good to double check.

Max

Took a fews days off, then back to the NO TX on the TS520
I have Carrier 3.395 at the Gate G1 of Q2 on the If Board .5vots on the ocilliscope, freq counter comfermed 3.395. On Gate G2 of Q2 on the If board I have 2.5v from the vfo 5.3 Mhz. The 520 receives great.
I can not get the Q2 tx mixer to work. its been changed resistors R21-24-25 have been changed. C22 C24 changed. Q2 changed twice. T4 I can get it to peek if I inject 8.695 at the Drain of Q2 but T3 will not show a change. I tried different values at C22..
When I inject 8.695 at the Drain of Q2 I can get the Radio to tx no problem..
What am I missing ? to get Q2 to mix and give me 8.695 out ?

well that's why I'm watching. I'm loking at it for the possibility of how it will perform with my VHF transverter. So far I haven't heard enough positive to say yes. I am giving it the consideration of the doubt at this point. It works well enough, but is it worth the effort and financial consideration. I got alot riding here right now.

Chris HEmbree <w7cth@...> wrote: I was told the audio was good!!
Chris..

John Harp <ka3dpw@yahoo.com> wrote: Well how is it on the air. Performance is what I'm watching this for.

w7cth <w7cth@...> wrote: I would like to report with the help of this group. I have all the mods done that I am going to do for now.C106 mic audio, report is good
with a Heil GM-5. New tubes the output went from 80W to 100W. With the
dioeds and 100 onm on the IF board PD mod. can't tell all that much
because the radio is new to me anyway.Deoxit all the controls and
major cleaning inside and out.The radio looks like it is off the show
room floor.

Thanks Guys

Troy,

First thing I would do is go back through all the connectors, making
sure they are plugged into the proper mating connector. I write the
connector number on the molex end as I remove them. Check for any you
may have missed when you plugged them back in. I had no signal once
and saw I forgot to plug the small coax cable back in at the rear. Did
you notice any loose board side connectors when you removed the
cables? I found quite a few on my IF board and a couple even came off
with the wire. I made a point to resolder all the pins back on the
board. I do this whenever I remove a board. Check to make sure all the
diodes were put in the proper way. Make sure your RF gain isn't all
the way down. I'm sure you checked all my suggestions but it's good to
double check.

http://home.comcast.net/~esprepair/ts830mods.htm

I see on this site there is a mod to unlock the IF shift on the 830. I curious about the pros or cons concerning this mod. VR2 on the PLL board is used to set the carrier insertion point, basically the TX side of the IF shift. I'm wondering if this mod unlocks the IF SHIFT to allow you to vary the insertion point from the front panel IF SHIFT control. If anyone cares to examine the schematic and offer their thoughts. I am curious about the purpose of D55.

I usually have a large number of messages when I check my e-mail and answer them in chronological order. It seems that Ruben and I had the same idea. However you found the problem to be associated with the 100 ohm resistor.

The 100 ohm resistor connects between the junction of the two 470 ohm resistors, R-75 and R-76 and ground. I suspect that you had one or more ends of it connected to the wrong place. I particularly suspect that the ground end was not on a ground point.

I see on this site there is a mod to unlock the IF shift on the 830. I
curious about the pros or cons concerning this mod. VR2 on the PLL
board is used to set the carrier insertion point, basically the TX
side of the IF shift. I'm wondering if this mod unlocks the IF SHIFT
to allow you to vary the insertion point from the front panel IF SHIFT
control. If anyone cares to examine the schematic and offer their
thoughts. I am curious about the purpose of D55.

10364. L19 L20 in TS-830

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-19 11:26:36 UTC
From: n9wb
Topic: 10364 Message: 10364

Once again, I would like to protest the de-tuning of L-19 and L-20 in the TS-830. This is a band pass filter and should be tuned for maximum or left as is if it is at the factory setting. De-tuning will corrupt it's filter characteristics. It will allow unwanted artifacts from the mixing process to pass through.

Max:

First, I absolutely do not recommend this mod. I would never do it to my TS-830. I believe that when a rig suffers too much modification, it eventually turns into junk. A lot of this is getting too much like the "butcher shop" mods done to CB radios.

However, with that disclaimer, I will discuss it with you.

The top side of VR 2 is supplied power during transmit. This forward biases D-56 and allows VR 2 to control D-57 that is a varactor diode.

VR 1-1 part of the IF shift control and is supplied power on receive. This forward biases D-55 so the IF shift network can control D-57. I believe that the power on VR 1-1 comes from RLR on the AF board and is 9V on receive only.

To do this, you would have to disconnect D-56 to disable VR-2 and supply 9v power on TX and RX to VR 1-1. If there are more than 1 wire going to the top (3) of VR-1, these will have to be connected together but removed from VR 1-1. Then the 9V applied to VR 1-1(3).

WARNING: this just my attempt to answer Max's question. I have not tried this, nor do I intend to. This is not a modification for the faint of heart.

I note that VR 1-1 is part of a network that also affects the BPT, so if you attempt this, do it in such a way that it can be restored.
I do not have a really good diagram so I cannot guarantee accuracy of my statements.
If you try this, and things go wrong, we may not be able to easily bail you out!

In my opinion this is Hype city.

If you really want to do this, we can figure it out and save $180.00.

I absolutely do NOT recommend the High POWER mod.

I will look into D-55

10366. Monr about L19 L20 in TS-830

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-19 11:57:27 UTC
From: n9wb
Topic: 10366 Message: 10366

The 8.375 oscillator is applied to mixer Q-16. The carrier oscillator signal from the PLL board is applied to the other gate of Q-16. The mix of these two signals is applied to L-19 and L-20. to buffer amplifier Q 18 and balanced mixer, Q2 and Q3. If L 19 and L-20 is not tuned properly, signals directly from the 8.375 and the carrier oscillator will pass through and create images in the receiver and spurious emissions in the form of artifacts of the mixing process on transmit.

It seems to me that it is important that this filter be tuned to be filtering properly.

I like that part Walt. No at this point I have no intention of doing any of the mods on that site. Doing the direct balanced modulator feed as I have solves the TX audio mod. I have swapped the caps in the audio amp to give more lows and I have no intention of doing the power mod. That is just plain silly and I agree that these type of mods are catering to the CB crowd, especially when they make references to how "loud" you will be.

That aside I was just a little curious about the IF SHIFT mod. I had VR2 wired to the TONE pot as I mentioned a while back, but I have since reversed that mod to keep the radio stock. Having a variable TX response might come in handy under certain conditions. I appreciate the explanantion.

10376. Any mods for the 830s side tone?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-19 13:34:28 UTC
From: Darwin, Keith
Topic: 10376 Message: 10376

After using the 830s for a while on CW, I switched back to the K2.
First thing I noticed was how much nicer the K2's sidetone is. 830s has
a rather nasty sounding side tone. It does not sound like a pure sine
wave and also plays dots shorter than they really are which is not good
for this straight key user.

Are there any recommended mods to improve the sidetone?

Just out of curiousity - when you mention unlocking the IF shift, I assume you mean completely disengaging it from the receive circuit? Why do it? To eliminate any insertion loss? Admittedly, the IF shift isn't always useful, but there are timew where I think it comes in pretty handy.

Or, do you unlock it, to get a greater IF shift capability (sort of like unlocking a PLL circuit, which is a bad thing). That sounds like a can or worms I wouldn't want to deal with.

73,
Ellen - AF9J

P.S. - Walt, you going do the Schottky mod? If you need somebody to compare it with, as one who is also a TS-820 & 820S afficionado, I'll do it at the same time with my baby, as you're doing it with your housecat special. If you want, we could even pool our purchases together for the diodes.

Hi Ellen,

What the mod does is allow the IF shift to function in transmit. All it would be doing is allow you to vary the carrier insertion point. As an example, lets say your rig is capable of transmitting an SSB signal from 300-2700 Hz. This is a 2400 Hz bandwidth. By varying the IF shift on transmit, you can adjust it for say a 500-2900 bandwidth, giving you more highs to help you bust through the pileups, or 100-2500 Hz to give you more lows for a nice ragchewing sound. Of course the radio would have to have the wider filters in it as mine does. 2400 Hz is not really wide enough to benefit from this mod. I can transmit 3000 Hz wide so I could use 100-2900 for the low end or 500-3500 for the high end. Of course if the guy on the other end doesn't have the filters for receiving that wide it is a lost issue. I just like to know what the capabilities of the radio are.

73,
Max

> Now, If you are not experienced in soldering, you can probably get by for now since the rig seems to be working. But if you are able to replace all of these resistors, it would be good preventative maintenance anyway. They are very inexpensive.
>

Thanks Walt,

Well this morning I think that it gave it up. :) Got up this morning and turned on the radio and was just listening on 80 meters and all or a sudden there was a series of loud 'pops'. No smoke or fried smell. I shut it off. Looking inside I found that the cathode resistors were both open. Checked R5 and R6 on the final board and one of them ohmed out at 125 ohms. Replaced both of them and the cathode resistors R2 and R3. While I was in there replacing those I found a ceramic cap - one of the .047uf ones and it had flamed and was charred on the top - may be where the smoke came from??

While I'm in here I'm changing out the three resistors R5, R6 and R7 on the high voltage board.

Do you know what the value of C3 is? Looks like .047uf - do you know what voltage?

Thanks for all your help.

" What the mod does is allow the IF shift to function in transmit." <snip>

Max, thanks for your explanation of the effect of the mod. I have no intention of CB-ing around with my radio, but it's very useful to have a better understanding of its various functions.

73,
Max, K5OVW

Yes it is. The 6146W is basically the militarized version of the 6146B. There are minor idfferences between the 6146B and the 6146W, nut the 6146W is a suitable substitute for the 6146B. Almost everybody who buys replacements for the 6146B tubes, buys 6146Ws, due to the fact that 6146Bs are gbecoming hard to find, and rather expensive.

An interesting note - if you buy the JAN/Phillips 6146Ws that RF Parts sells, they are basically indentical to a 6146B. They cost a bit more than the average 6146W, but in my opinion, they're worth it. I put a set of them in my TS-820 this last April. They neutralized very easily, and I get 125-130W out on all bands.

A word of warning to you - AVOID THE CHINESE 6146B AND 6146W TUBES LIKE THE PLAGUE! I made the mistake of buying a set of Chinese 6146Ws from AES (I only live 10 miles from the Milwaukee store, so I figured I would save on the waiting, and postage I'd have to pay for a set I ordered elsewhere). They were branded as Penta (the US vendor of the tube). The Chinese tubes may work will with rigs that run lower plate voltages than the 900V the Kenwood hybrids run, but they sure didn't work well with my TS-820. As some of the group members will remember me mentioning, as soon as I turned on the cathodes, the tubes flashed/arced over between the cathodes and the plates. The end result - I got the opportunity to open up my 820, and replace trashed High Voltage Board resistors, and resitors on the Finals Board that were iffy from this little experience. Not aonly that, but now I'm stuck with a set of tubes I paid $54 for. The JAN/Phillips 6146Ws I bought from RF Parts, cost only $4 or $5 more, and are infinitely better. Ugh! You get waht you pay for. Other members of this group have had similar experiences with Chinese 6146W tubes.

Thank you so much for the timely reply. I called Purchase Radio in Ann Arbor Michigan and they have Chinese 6146-B tubes for $29.95 ea. I was going to get them, like you said, save the time and postage. I will order the RF parts ones for the same price and pay the postage and bid the time. Regarding my present tubes. I can get high wattage from them, do you think I should try, re-neutralizing them? I almost forgot. Purchase radio has been around for over 80 years. They have one set of RCA 6146 (no A or B). They want a little more for these, but I am doubtful they are a matched pair. What do you think?

I thought of that also Walt. On mine, I put the resistor on the Circuit side of the IF board from the junction of R75 and R76 over to the outer ground Trace just below TC1.

I usually have a large number of messages when I check my e-mail and answer them in chronological order. It seems that Ruben and I had the same idea. However you found the problem to be associated with the 100 ohm resistor.

The 100 ohm resistor connects between the junction of the two 470 ohm resistors, R-75 and R-76 and ground. I suspect that you had one or more ends of it connected to the wrong place. I particularly suspect that the ground end was not on a ground point.

Hi Rich,

Yes you should be able to use the 6146 in place of the 6146B in your Kenwood. It'll just put out less power. BUT, I'd watch things closely for a while after you install the 6146 tubes. This is due to the fact that the 6146 only dissipates about 90W max. input power (so the output rating for a 6146 tube is about 45-50W). The 6146B dissipates 120W max. The Kenwoods run higher voltage than your typical rig that uses 6146Bs, so there is the potential for additional stress on the tubes.

73,
Ellen

Hi david.I hope you have not purchased the Chinese tubes. I fell for
that one a short time ago never again. They flashed over, took out the
cathode resistors and most of all cooked the RF choke in the PA. Had a
job to find another but in the end had to rewind the old one. Its true
what Ellen said the Chinese tubes are ok in rigs with a lower plate
voltage but not a Kenwood 530 which is what i have.
I am keeping my fingers crossed that you have found some good US tubes.

RF Part has some 6146 tubes labeled Phillips. This was actually the last production run made by Sylvania. I looked these over at Dayton. They are of superior construction. these are what I recommend.

I fully agree with the advice about the power transformer. There is an article in the files section of this site called "save your transformer" It describes using a light bulb while troubleshooting a problem such as yours.

Is your idle current set properly ? Very high idle current can cause the problem that you are experiencing, however shorted tubes are the most likely cause.

Dave: I have not bought 6146 finals since I last needed them for a SB101. I see RF Parts has 6146W-MP. Is that an acceptable substitute for the 6146-B ?

David Rust <dlrust@...> wrote: Lucky me, I have a dozen fuses..

Rich, Not to sound like a smart a.. you may not have a dozen tries left in your power transformer. I feel like you are looking over the edge if you keep blowing fuses. You must find out what is going wrong asap. I would first suspect finals, but there are lots of other possibilities you should rule out one at a time.

But, be careful, a power transformer would become a major problem.

Ken,

I don't have the Chinese tubes. Did a lot of reading about them before
I changed tubes. I have 6146W's that I purchased NOS about a year ago
- I think that they are GE's. Definitely not chinese. :)I also have my
original set of 2001's. I have the radio put back together with the
reistors and capacitors replaced.

I've set up the transformer saver.

Here's what I get. When I turn the rig on it is bright and quickly
fades to dim and stays that way.

When I turned on the SG switch the same thing except not as bright
then quickly fades to dim. It is holding a steady dim right now.

What should I do next? :)

Just out of curiousity - when you mention unlocking the IF shift, I
assume you mean completely disengaging it from the receive circuit?
Why do it? To eliminate any insertion loss? Admittedly, the IF
shift isn't always useful, but there are timew where I think it comes
in pretty handy.

Or, do you unlock it, to get a greater IF shift capability (sort of
like unlocking a PLL circuit, which is a bad thing). That sounds
like a can or worms I wouldn't want to deal with.

73,
Ellen - AF9J

P.S. - Walt, you going do the Schottky mod? If you need somebody to
compare it with, as one who is also a TS-820 & 820S afficionado, I'll
do it at the same time with my baby, as you're doing it with your
housecat special. If you want, we could even pool our purchases
together for the diodes.

Ellen,
You should have told me that you were interested in some Schottky Diodes. I moved 400 of them in a few days. Are you still looking for some ? They are only 11 cents each when ourchased in bulk.
It costs more to mail them then the Diodes cost.. hi hi...

I might be Gordon. I just didn't know until recently, if the
Schottky diode mod would be of much use in my 820. I'm not even sure
how many I'd need.

Thanks Ellen, I learn quite a bit here, glad I found this site. I have decided to order the RF parts tubes. I will let you know how they work out. Thank you again, Rich

Ellen R <ellenjoanne2003@...> wrote: Hi Rich,

Yes you should be able to use the 6146 in place of the 6146B in your Kenwood. It'll just put out less power. BUT, I'd watch things closely for a while after you install the 6146 tubes. This is due to the fact that the 6146 only dissipates about 90W max. input power (so the output rating for a 6146 tube is about 45-50W). The 6146B dissipates 120W max. The Kenwoods run higher voltage than your typical rig that uses 6146Bs, so there is the potential for additional stress on the tubes.

73,
Ellen

Ok. :) Checked the cathode resistors and they are fine. I ran the radio in receive for awhile plugged in through the transformer saver first with the SG switch off, then for awhile with it on. Everything seems fine. Took it off the transformer saver and still seems fine. HV is about 850 on the meter and IP at 60 ma. Tuned it up into a dummy load and that seems normal as well. I think it is working fine.

Thanks for the help.

Ellen
I replaced all 16 and am more than pleased with the results. Using a G5RV in North Vancouver I could never hear the East coast. I could see the needle bouncing as I tuned across the band but no audio above the noise. Also not scientific but only observation, I used to have 4-5 S units of noise at all times. Now I here folks from New England to Florida and the noise is S2-3 most days.
regards
Barry

Hi Rich,

Thanks for your reply. Yes, I think you are right, the "D" model of the 520 was the Japenese or non-US version. I asked because I may pick one up that is not working as a project and had never heard of the "D" model.

Thanks again.

Steve K7QHU

If you google Kenwood TS520D you will almost always find the sites are in Japanese and refer to the product as TRIO. More than likely the Japanese version of the S. A friend of mine has an Icom 760, he bought it in Japan when he was there and it is virtually a 761. Maybe the same with the Kenwood TS520D? I am sure you will get lots of replies. Good luck, Rich

Hi Walt.

Do you know where I could find the proper Kenwood procedure for tuning L-19 and L-20 in the TS-830S? It could be in the service manual, but I don't have mine with me right now to check. Thanks.

Once again, I would like to protest the de-tuning of L-19 and L-20 in the TS-830. This is a band pass filter and should be tuned for maximum or left as is if it is at the factory setting. De-tuning will corrupt it's filter characteristics. It will allow unwanted artifacts from the mixing process to pass through.

From: Bob M
Topic: 10403 Message: 10403

G'day All,

Well the YK-88SN Filter turned up today and I fitted it.
It seems to be working fine, when I go to 10Mhz
and turn on the Calbrator the Narrow switch now
makes the signal over a very narrow BW.

The only thing I'm not sure of is the Jumpers.

The unit had a YK-88S and a YK-88CN in the first
two allocated spaces and the Jumpers were on B
to SSB and A to CW.

I do not use CW at this time. so I placed the
SN filter into the SSB Narrow location and moved
the B jumper to SSN.

So now I have

YK-88S
YK-88CN Jumpers at A to CW and B to SSB
YK-88SN

Befor the change I had no receive with the Narrow switch in now I have
as siscribed in irst sentance above.

Is this correct?

Many Thanks
Bob M.

Jerry:

Nice set up! I see you have the "spinner knobs" on the TS-820 and the VFO. Interesting speaker. I am glad that you have ventured beyond the run of the mill communications speaker. Do the Tweeters have wires that are accessible on the back? If so, you may want to add switches to turn them off and on to change the frequency response for given conditions. Too bad about the ordnance on your antenna. In my opinion, in order to properly accommodate an Amateur Radio Station, the maximum height should be 1000' hi.
Hope you have joined the Kenwood QSO group. Hope to talk to you soon!

Could this be the model that had only 1 final ?. There was a license class in JA that had a limit of 75 watts and some rigs were made with one final to accommodate this. These can be converted to two tubes, but they drive amplifiers very lightly as is for a very nice clean signal as is.

This would be perfect for a Collins Thirty S one that requires 60 W PEP drive.

TS 530:

If it ain't broke, don't fix it, however if you are into your TS-530 doing something you may wish to check the following resistors that are known to change value with age:

On the rectifier unit board, R-15 is 56 K. R-111 is 470 ohms. These often change in value with age. These are easily obtainable 1/2 watt resistors. They can be carbon, carbon film, or metal file type. Lift one end and check them. If they look bad or check out of tolerance, replace them.

On the R2, R3, R4, R5. are 20 ohm resistors. These are 1 watt and the wattage should NOT be increased. the 4 of these in parallel should measure 5 ohms.

Check across one of them in circuit. If you get 5 ohms and they look good, don't worry about them. If they check outside of this or look fried, replace them.

> Now, If you are not experienced in soldering, you can probably get by for now since the rig seems to be working. But if you are able to replace all of these resistors, it would be good preventative maintenance anyway. They are very inexpensive.
>

Thanks Walt,

Well this morning I think that it gave it up. :) Got up this morning and turned on the radio and was just listening on 80 meters and all or a sudden there was a series of loud 'pops'. No smoke or fried smell. I shut it off. Looking inside I found that the cathode resistors were both open. Checked R5 and R6 on the final board and one of them ohmed out at 125 ohms. Replaced both of them and the cathode resistors R2 and R3. While I was in there replacing those I found a ceramic cap - one of the .047uf ones and it had flamed and was charred on the top - may be where the smoke came from??

While I'm in here I'm changing out the three resistors R5, R6 and R7 on the high voltage board.

Do you know what the value of C3 is? Looks like .047uf - do you know what voltage?

Thanks for all your help.

I click on the link and it takes me right to the files library.
Choose a folder, then choose a file do a right click to download the file.
It's working for me...Need more help? Let me know...

10416. VFO on TS 820s not working

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-20 13:56:31 UTC
From: w1ioo
Topic: 10416 Message: 10416

I am referbishing an 820s. The set receives with the external vf0-820 but not with the internal vfo. The vfo plug is in place and the 9 volts is present on plug of the vfo unit. Looking at pin 1 on the vfo plug there is no signal with the internal vfo but present with the external. Before I start to take the vfo appart Is there something else I may have overlooked and not checked. Thank you all in advance. Wally

Ruben
Try
http://bama. edebris.com/ manuals/
Much easier for those of us who are not proficient at FTP.
If you can get to the directory on the FTP server and see the file
name you want just right click, save as.
regards
Barry

10422. Re: VFO on TS 820s not working

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-20 15:14:54 UTC
From: w5rkl
Topic: 10416 Message: 10422

You didn't state whether your 820 had the digital display or not. I'm going to assume it doesn't. If it does have the digital display but nothing is displayed on the digital display then the following will determine if there is any output from the VFO. Do not remove the shorting plug or wire between pins 8 and 9 on the rear.

If you have an all band receiver such as an FT-857D, TS-930 or any other all band transceiver, you can check for VFO output. Simply unplug the RCA plug on the rear of the 820s internal VFO. Using a video cable, the yellow colored cable that's used to connect VCRs, DVD or other video components to a television system, plug one end into the VFOs output. Place the other end close to the receivers antenna connection. Tune the receiver to 5 Mhz. Tune the 820 VFO until you hear the signal. It should be rather strong.

If you do not have an all band receiver but you have a frequency counter or o'scope, connect the output of the VFO to the counter or o'scope. The signal should be clean and stable as you tune the VFO.

If there is no output from the VFO more than likely the transistor is bad. If there is output but the 820s not working using the internal VFO, then the VFO cable more than likely has an open somewhere in the RCA plug, the cable itself or an internconnecting point between the VFO and the IF board.

When doing this check, leave the 2 prong power cable connected to the rear of the VFO. You also do not have to transmit to perform this simple test, so leave the 820 in receive mode.

Rich -

If you are using a browser to gain access to the ftp site then you need to do a right click->save before you can access the file.

or you can drag the file from the ftp site to your desktop and that will save it as well.

Topic: 10416 Message: 10424

Wally.

Mike just gave you some good analysis methods. Let me tell you about the problem I fixed on a VFO-520 last week. The 520 radio worked fine with it's internal vfo, but when I switched to the remote vfo, no receive signal was heard - just the residual noise from the audio output amp when the volume control was increased. I did testing with a scope and saw that the remote vfo had a very strong signal output (about 3.8Vp-p as I recall), so then I started tracing wires. I found two broken coax center leads - one in the interconnecting cable, and the other on the remote vfo socket inside the TS-520 radio. So I would recommend that you do some wire tracing before jumping off into something more serious. The solid center conductor of the coax cables Kenwood used are very fragile. Good Hunting.

Rich.

Save yourself a lot of grief and just go to http://bama.edebris.com/manuals/ . It should come right up for you. I have also experienced lots of problems with the other site, but this one works every time. As one of the guys said, if you can download djvu to your computer sometime, that will give you the best displays when viewing those kinds of files. Good luck.

Rich, once you locate the file that you're interested in... just do a right click on the file name and select download, the window
will open up and you choose the directory that you want the file to go into. If you double click on the file as you normally
would you'll get an error. It's your last step that's causing the problem.

10428. Re: TS-820S Relay

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-20 17:17:20 UTC
From: w5rkl
Topic: 10374 Message: 10428

Yes, you can use a resistor in series with a relay coil. You will, however, have to computer, using ohms law, the correct resistor wattage.

A relay coil requires a minimum current to begin pulling the relay close. This can be computed using the following ohms law formula:

I = E/R

I is the total current through the relay
E is the source voltage
R is the relay coil resistance.

A relay coil with a DC resistance of 300 ohms and a source voltage of 12vdc will draw .040 ma (40 ma) of current. However, a relay coil with a DC resistance of 150 ohm will draw twice the current. See the following ohms law math:

Source voltage: 12 vdc

Relay #1
12/300 = .040ma (I) (relay coil resistance of 300 ohms)

Relay #2
12/150 = .080ma (I) (relay coil resistance of 150 ohms)

The power consumed in both instances using ohms law math is:

P = I x E

300 ohms relay coil = .48 watts (1/2 watt)
150 ohms relay coil = .96 watts (1 watt)

73s,

Mike
W5RKL

10429. TS-830s with low output.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-20 18:00:36 UTC
From: k4chs
Topic: 10429 Message: 10429

My TS-830s works great...with the exception that the TX only puts out 35 watts (CW). This is a recent change from full outout. I have measured the high voltage and it is only 425 VDC in keydown mode, 700 VDC in receive.

I have measured the power transformer secondary and on the 800 VAC pin I only get 450 VAC compared to the 0 VAC side of the seconday winding. All other AC secondary voltages are reduced by 35% or so. This leads me to think that I may have a shorted primary winding...any body have any thoughts on this issue.

Thanks,

Mac, K4CHS

Topic: 10429 Message: 10431

Mac, K4CHS,
I just had a similiar circumstance with my 830s. It was suggested by one of the members here to replace the two filter capacitors. The exact replacements are not available, however, I got a couple from DigiKey that worked just fine.

My HV is back up where it belonged, and I have full output. DigiKey Part P7448-ND. If they don't have that I thank P7449-ND is the same thing. Both are 100uf 500 volt.

10433. 820S problem found

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-20 21:16:08 UTC
From: w5rkl
Topic: 10433 Message: 10433

Well after a troubleshooting task and a process of elimination on my 820, I finally found the problem on receive. I couldn't get an IF signal through nor could I get anything through, even feeding the signal into the RF amp, RF amp buffer and mixer stages. All the frequency controlling circuits were working fine and very stable looking on the scope. All the transistors in the RF amp, RF amp buffer and mixer stage couldn't be bad. Finally, after turning the function switch back and forth, I heard a very brief tone that stopped as I turned the switch further. I turned the function switch slowly clockwise, as though I was turning to VFO R. Half way between VFO and VFO R, the receiver came to life and I heard the 8.830Mhz injected IF signal and the signal pegged the meter. Removed the IF signal, injected a 7.150 at the antenna input, dialed up 7.150 on the 820 and there it was, S9. Adjusted the preselctor and coil pack, 20 over. I'll need to do further adjustments once I repair the function switch.

Now it's just finding which wafer on the function switch is bad. I've read it's a real bear to work on. Any suggestions by anyone who has done this? I would suspect removal of the switch should indicate which one has turned or is bent. Sitting here listening to 2 guys chat on 40 CW at 25 wpm, very nice sound to hear. he he he...

Thank you Bill and Mike. I looked at the output of the VFO and the sine wave was about 15mv p-p. The frequency was correct for the VFO output. It was not stable. I have a copy of the service manual and it shows how to take the VFO out. I also have a schmatic of it with voltage readings. Probably a transistor or two gone. Will dive into it this weekend. Will let you all know the results.

> Mike just gave you some good analysis methods. Let me tell you about the problem I fixed on a VFO-520 last week. The 520 radio worked fine with it's internal vfo, but when I switched to the remote vfo, no receive signal was heard - just the residual noise from the audio output amp when the volume control was increased. I did testing with a scope and saw that the remote vfo had a very strong signal output (about 3.8Vp-p as I recall), so then I started tracing wires. I found two broken coax center leads - one in the interconnecting cable, and the other on the remote vfo socket inside the TS-520 radio. So I would recommend that you do some wire tracing before jumping off into something more serious. The solid center conductor of the coax cables Kenwood used are very fragile. Good Hunting.

All,

I know that this is off topic, but I am despert!
I just received a Wavetek Model 3007 Signal Generator without the probes and service/operations manual. I am seeking assistance in finding a source to purchase probes and a source for the manual or a copy. Any and all assistance is appericated. I have done a Goggle search but no luck yet.

Thanks,
Walt, KA2NJF

Not quite what you want, Walt, but the manual for models 3003-3006 (which might be close enough) can be downloaded at:
http://www.bitsavers.org/pdf/wavetek/<http://www.bitsavers.org/pdf/wavetek/>

From: Bill Scurlock
Topic: 10416 Message: 10440

Wally.

I followed the manual directions when removing the vfo from my TS-820 and everything went well. Just try not to disturb any of the mechanical gearing in the process. After you get the vfo module out of the radio, there are ways to position it on the workbench without it resting on the dial assembly which is larger than the vfo enclosure. We will be interested in what you find.

10441. [TS-520_820_530_830] Shottky Diode Mod - Spectrum Analyzer -Before/After

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-21 05:16:00 UTC
From: Rick
Topic: 10441 Message: 10441

Hello All,

Since I more or less started this push to install 1N5711 Shottky diodes after talking with Gordon on 20 meters a while back, I thought I would try and measure and/or display what exactly was happening with the receiver. Was the receiver actually quieter because of lower noise floor with the same sensitivity or was something else at work here. I have an absolutely stock 830S...Serial number 21XXXXX that I decided to do a before and after noise level test, (YK-88S1 2.7khz filter), swapping out the stock 1N60's with the Shottky 1N5711's. I used a shielded 50 ohm BNC terminator cap off of an old Novell network as my dummy load to reduce any stray signals. I then used the calibrate signal to tune a 1khz tone and the AF control to put it right on the 0dB level on the Spectrum Analyzer program I use. I then turned off the calibrate signal and let the analyzer program run simultaneous both a Free and an Average plot for 60 seconds in both tests. I only swapped out the four diodes in the product detector, added the 100 ohm resistor and peaked L19 and L20 for 600mV. No other changes.We know all solid state devices generate noise. Some more than other. After the test I include the 1N60's in the very noisy class. In the jpeg, the blue is the free running audio and the red is the average. You will notice a very obvious spike at about 300hz on both graphs as a reference. There is a pretty dramatic difference. I am open to any ideas as make this a more accurate test. I loaded the resulting jpegs into the files section of the group.

I need help clearing up some confusion. It has been posted that setting up L19 and L20 after the diode mod to 600mv is not the best way to do this.What would be the best way to set this up?After I did this mod the USB and LSB did not match so I Adj. them both to 600mv with the scope.
I am a Vergo and a perfectionist and when thing are not right it drive me nuts.

What I find interesting is the high frequency roll-off. In the before pictures the skirt of the filter is plainly visible. In the after it is off the scale.

OR is it just that the noise floor is that much lower as the frequency increases????

Hi Clif,

After installing the 1N5711's, it is interesting that the lower freqs from 1khz down are virtually the same level while above 2khz the roll off is in the 10dB area as the frequency rises. . Are there any published noise figures of the 1N60 or diodes in general? It would appear they generate a lot of noise in the higher end of the spectrum. No wonder listening with headphones gave me a headache.
I wonder if I should pull the 100 ohm resistor off the LO to see how much of an effect it has.
The question I have for you is since the noise level is -60dB down from the reference tone I used, what is used as the reference to calculate noise floor. I see typical values of -138dBm etc....I don't know how accurate the program is I used but it is an interesting comparison.

Hi Clif,

I need to re-phrase my question...instead of noise floor, I should have asked how is MDS calculated? What is used as a reference point as it is obvious that my noise level is -60dB down from my reference I used and there is no way I would hear a signal in the -138dB level.

Hi All,

As noisy as the 1N60's seem to be in the product detector, they are also used in filter selection as per the schematic. I am not sure if the 1N5711's will handle the current level in the I.F. chain but I think I will swap the 1N60's out today and re-sweep the noise level. Thanks to Gordon, I have enough 1N5711 diodes to 'kill' a few if it doesn't work. I have some 1N4148's to try if the Shottky's won't handle it.

Analyzer -Before/After

Hello All,

Since I more or less started this push to install 1N5711 Shottky
diodes after talking with Gordon on 20 meters a while back, I thought
I would try and measure and/or display what exactly was happening with
the receiver. Was the receiver actually quieter because of lower noise
floor with the same sensitivity or was something else at work here.
I have an absolutely stock 830S...Serial number 21XXXXX that I
decided to do a before and after noise level test, (YK-88S1 2.7khz
filter), swapping out the stock 1N60's with the Shottky 1N5711's. I
used a shielded 50 ohm BNC terminator cap off of an old Novell network
as my dummy load to reduce any stray signals. I then used the
calibrate signal to tune a 1khz tone and the AF control to put it
right on the 0dB level on the Spectrum Analyzer program I use. I then
turned off the calibrate signal and let the analyzer program run
simultaneous both a Free and an Average plot for 60 seconds in both
tests. I only swapped out the four diodes in the product detector,
added the 100 ohm resistor and peaked L19 and L20 for 600mV. No other

changes.We know all solid state devices generate noise. Some more than other. After the test I include the 1N60's in the very noisy class. In the jpeg, the blue is the free running audio and the red is the average. You will notice a very obvious spike at about 300hz on both graphs as a reference. There is a pretty dramatic difference. I am open to any ideas as make this a more accurate test. I loaded the resulting jpegs into the files section of the group.

You could always build a simple diode noise generator test setup (diode, battery, pot)using a "reference diode" for a start, and then you can test any diodes for degree of noise when current is passed through them. We've used simple noise generators to set up VHF and UHF converters for years. Check any 60's or 70's Handbook for the simple circuit.

10460. Re: VFO on TS 820s not working

Yahoo group: TS-520_820_530_830 (2006)

Topic: 10416 Message: 10460

Wally,

You said the VFO had a good output but the VFO output is not stable. By unstable, does the VFO output become unstable when you tune the VFO or is it unstable without tuning? Is the instability at any point throughout its rotation or in one spot? I've seen it both ways.

I've repaired alot of VFOs, LMOs, PTO, etc, that had instability in their output signals. Cleaning the tension spring contact point, 95% of the time, clears up the instability.

I agree with the others in that removing the VFO at this point may not be the best course of action. Look at the side of the VFO. There should be a small plate with 2 screws holding the plate to the VFO case. This allows access to the VFO capacitor shaft to clean the tension spring contact point without removing the VFO from the radio. Remove the side plate and give the tension spring a shot of DeoXit and rotate the VFO throughout its travel a couple of times. Repeat the procedure after a minute or two then wait a couple of minutes before powering up the VFO. Check the VFOs output. Is is stable now? It should be. I would also clean the RCA male plug with a shot of DeoXit then insert the plug into the female socket a couple of times.

Dirt accumulates over time and interrupts the continuity between the variable capacitor shaft and the capacitor frame, causing instability in the VFOs output signal.

If the VFO still exhibits some instability at certain points in the rotation then the use of a brush may be needed. A word of CAUTION is needed here. If you use a brush, extreme care MUST be used to prevent damaging the capacitor plates and surrounding components. Use only slight pressure and slow scrubbing action. It doesn't take much to get the dirt/corrision out. Again, use CAUTION when performing this task. I only use a brush when absolutely necessary. A childs tootbrush, soft bristles, is perfect for this. Do not use a stiff bristle brush! If there isn't room to do this, you can heat the point just below the bristle area on the brush and bend it to fit. Just take your time and use very little force and only slight back and forth scrubbing motion, three of four strokes are all that is needed to dislodge the dirty/corrosion.

10461. Re: [TS-520_820_530_830] TS520SE

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-21 17:49:47 UTC
From: David Rust
Topic: 9304 Message: 10461

I think I told the group I had a 520SE I got from the usual marketplace. No transmit, it popped and spit and i thought blew a fuse. Didn't blow a fuse, I hooked it up today, receive works perfect on all bands. I can turn on the crystal calibrator and turn the bandswitch through all bands and they are all almost right on.

After looking at the bottom of the chassis, the usual smoke marks are around the bottom of the tube bases on the bottom of the board. So the usual resistors I think are gone as well as a couple finals. Doesn't look like a hard fix. Anyway, to me thats a lot easier than having to trouble shoot a receive problem. I'll keep the group informed.

Its amazing how well these receivers sound hooked to a good outboard speaker.

Topic: 9948 Message: 10462

Ok we are getting somewhere now. I do _not_ have the 2.9v on the AGC line coming into the IF board (0.00v). Likewise 0v on the RF board connector #5 pin 1. Working back to Q1 on the RF board, 0 volts on this same lead, supposed to be 2.7v on the schematic. When you said you had a bad disk ceramic shorted to ground, was it the C45 right here? Unless a better recommendation appears I'll lift C45 and R12 to test...

To: Ron Hauser
Subject: RE: [TS-520_820_530_830] Pesky S-Meter (TS830)

Hi Ron,

OK on the voltages ...I would pull the wire plug off of connector #15 on the IF board and check pin 3 on the plug. . This is the AGC line that brings the 2.9v onto the IF board. If it checks out for 2.9v then somethng on the IF board is dragging it down. If it is still 1.12v, than the problem is NOT on the IF board. The AGC line comes from the RF Board (connector # 5 pin 1). I am sending a shot of the RF board.... I had a bad disc ceramic capacitor one time that was shorted ...Drove me nuts until I finally found it.

The AGC line on the I F board goes to Q4, Q8 and Q10 plus Q11 and Q12 that you already checked. I would check the bypass caps off the transistors the AGC line goes to and C177 and C184 on the end leg of the AGC to the left of Q31

We having fun yet?

Lamar, Colorado

Ron Hauser <eichmann@...> wrote:

Hi Rick, thanks for pointing me to Q11 and Q12 on the IF board... I had
"almost" figured out that is where I want to look.

First I checked the TX/RX relay contacts, and gave them a cleaning with a
piece of paper and some Deoxit. It was looking very bright and shiny when I
opened it up, and I did not get a change in behavior.

Next I checked voltages around Q11, Q12. The supply to R73 and Q11 is 8.98v

(ok). The three leads of Q12 are 0v (ok), 4.24v (4.3v specified as
nominal)
4.87v (4.8v specified). That seems pretty close. The two leads of
Q11 were
5.92v (5.7v specified), and 1.12v (2.9v specified). That seems to be
a
problem.

I also checked the resistors around VR2, VR3. I pulled R72, R73, R74
off
the board but all checked out within tolerance. Interesting note,
the
schematic has an error, it has R92 as a typo for R72, that was a
nice bit of
confusion.

I'm thinking that I'm onto something with the values around Q11 but
now I'm
back to poring over the schematic trying to decide where to go next.

BTW, When I go through the calibrate procedure for the S meter I
never get
more than S4 as the biggest peak on the calibrator signal.

Thanks for the help, and any more ideas will be welcome!

Hello all
My bag of replacement caps for the PS arrived today. The chassis is repainted and and the face is repainted. Re-assembly has begun. I am just curious about replacing the caps. The old ones had no leaks or shorts. They were just down about 50% in uFarads. Should I be replacing them as others have by hiding the new ones inside the old ones or should I simply be bridging the new ones in parallel to the old ones. By bridging I would end up with 150% of the original capacitance and I can't see where this would be detrimental in the filter caps.
TIA
Barry

Chris.

I finally went to the shop and got my TS-830S Service Manual (partial copy). If you will look in the adjustment section of this manual under Item #6, you will find the original procedure to adjust L19 and L20. In the AG6K procedure, item #11, Richard insinuates that the local-oscillator input level to the Product Detector is too high. He adds the 100 ohm resistor to terminate the input from the local-oscillator, and specifies that the voltage across this new 100 ohm resistor should be approximately 600MVp-p. Several of us that have made this modification are accepting that Richard somehow determined this level correctly. In Item #6 of the Service Manual, they specify that the voltage should be set at 0.3V as measured with an RF Probe on a VTVM connected to the short jumper near Connector #9 on the IF Board. If I am converting the 0.3V correctly to a Peak-to-Peak reading on a scope, the 0.3v is approximately 850MV. So Richard's 600MV represents about a 30% reduction in signal level. In both the Kenwood Service Manual and the AG6K procedure, they specify that the USB and LSB voltages be set equal to each other. I would have to have much fancier test equipment and more knowledge to determine for myself what the correct answer is. Walt has expressed some concern about the AG6K procedure, but I'm not smart enough to know who is correct - maybe both of them - just at different signal levels.

Anyway, I have done the AG6K procedure to one of my 830's, and to my ear everything is working fine. It is very tedious to set L19 and L20 for 600MV on LSB and USB, but it is do-able. It may be just as difficult to do this equalization when peaking the signal rather than limiting it to 600MV - I haven't tried it.

Maybe one of the other guys who have done this will give you some input also. Have fun, and let us know how it works out for you.

From: digs4ruff
Topic: 10247 Message: 10467

Another re post of this question but I seem to have missed any reponses.
One of the diode rectifiers in the PS has been replaced. The originals are SE-05's and the replacement is a 1N4004. When I look both of these up on NTEs cross reference I get NTE116 as the cross reference. Can I assume that the 1N4004 is a substitute for the SE-05? All diodes check good with the Ohmeter but am wondering if the SE-05s should be replaced while the PS is dismantled.

Thanks
Barry

Measure the noise floor. Input a signal from a calibrated signal
generator to a level 3 db above the noise floor. That is MDS by the
ARRL method. It should be easy with the software you have as long as
you have the generator. As most generators will not go below -127 to
-130 you will need a step attenuator to dial in the low level.

Your 830 should have an MDS in the -135 to -140 range

Clif

Welcome to the group.
I just picked up a 830s about 3 weeks ago and did a few mods from the group. The radio works great and is back on the air.
Just dig in and learn and have fun..
Chris W7CTH

John Harp <ka3dpw@yahoo. com> wrote: Greetings and welcome to the group. Wish you well with the 520. What's it's wattage out put been like. Tell us that first.
As for the keying there are two basic types of keying. Your 520's manual tells you which type of keying you will need to use. Most keyers are capable of both types of keying. Most tube gear goes with the one type of keying and solid state generally goes with the other. As the messages come to greet you someone will probably have an answer for you. I own TS-830 and my name is John.

cpitre_01 <cpitre_01@yahoo. com> wrote:
Hello all,

I am new to the group and I am lucky enough to own a ts 520. I
actually have almost a complete station, that includes the 520, the
at200 tuner, the sp520 speaker, the vfo 520, the TS 520, mc50 mic and
a pc1a phone patch. I purchased it off another Ham who was
downsizing. Any way I have a couple of questions.

Could I connect a keyer to this radio so I can use an iambic paddle?
If so is there a specific model I should get.

And when should I think about replacing the tubes, I don't know if the
tubes in the radio are original.

Thanks all
Chris

Subject: [TS-520_820_530_830] TS-510 Power Supply Restoration

Hello all
My bag of replacement caps for the PS arrived today. The chassis is repainted and and the face is repainted. Re-assembly has begun. I am just curious about replacing the caps. The old ones had no leaks or shorts. They were just down about 50% in uFarads. Should I be replacing them as others have by hiding the new ones inside the old ones or should I simply be bridging the new ones in parallel to the old ones. By bridging I would end up with 150% of the original capacitance and I can't see where this would be detrimental in the filter caps.
TIA
Barry

Bill K5GCW:

Thank you for telling us where this procedure is in the service manual. I looked quickly the other morning and could not find it.

The procedure for setting L19 and L20 specifies using an RF VTVM. I would consider a VTVM with an RF probe such a device.

It shows to adjust L-19 and L-20 for maximum.

Note L-20 the slug of L 20 should be adjusted while turning it counterclockwise.

The next step is:
If the voltage is outside of the specified limit, adjust L-19 and L-20 until the voltage is .3 volts on both USB and LSB.

The.3 volt specification is given a tolerance of +/- 1 dB. This would mean that it should fall in between .267 V (267 mV) and .337 9337 mV).

It does not state whether this is RMS. or P/P. However since it specifies an RF VTVM I would expect it to be RMS.

On a scope, you would be seeing P/P between the =/- cycle peaks.
.3V (300 mV) will = .848V or (848 mV) P/P.

AK6K specifies 600 mV.P/P. This would be 212 mV RMS.

Note by mV I mean millivolts not microvolts.

.....
My (N9WB) comments, NOT meant as gospel and subject to change if confused by facts..

Note L-20 the slug of L 20 should be adjusted while turning it counterclockwise.:
I would interpret that to mean that after peaking L-20 the slug should be detuned clockwise and then brought back to the exact peak by turning it counter clock wise.

I don't know what to make of the levels. I can't help but wonder what would happen if we peaked L 19 and L-20 for maximum receive of a weak signal ?

Or what would happen if we peaked L-19 and L-20 for maximum RF voltage and then touched them up for equal voltage on each sideband.

Perhaps somebody can experiment with these coils and see what effect the level has on weak signal reception. Since these act as a bandpass filter, it bothers me to see them detuned too much.

Subject: Re: [TS-520_820_530_830] Re: L19-L20 Adjustment.

Chris.

I finally went to the shop and got my TS-830S Service Manual (partial copy). If you will look in the adjustment section of this manual under Item #6, you will find the original procedure to adjust L19 and L20. In the AG6K procedure, item #11, Richard insinuates that the local-oscillator input level to the Product Detector is too high. He adds the 100 ohm resistor to terminate the input from the local-oscillator, and specifies that the voltage across this new 100 ohm resistor should be approximately 600MVp-p. Several of us that have made this modification are accepting that Richard somehow determined this level correctly. In Item #6 of the Service Manual, they specify that the voltage should be set at 0.3V as measured with an RF Probe on a VTVM connected to the short jumper near Connector #9 on the IF Board. If I am converting the 0.3V correctly to a Peak-to-Peak reading on a scope, the 0.3v is approximately 850MV. So Richard's 600MV represents about a 30% reduction in signal level. In both the Kenwod Service Manual and the AG6K procedure, they specify that the USB and LSB voltages be set equal to each other. I would have to have much fancier test equipment and more knowledge to determine for myself what the correct answer is. Walt has expressed some concern about the AG6K procedure, but I'm not smart enough to know who is correct - maybe both of them - just at different signal levels.

Anyway, I have done the AG6K procedure to one of my 830's, and to my ear everything is working fine. It is very tedious to set L19 and L20 for 600MV on LSB and USB, but it is do-able. It may be just as difficult to do this equalization when peaking the signal rather than limiting it to 600MV - I haven't tried it.

Maybe one of the other guys who have done this will give you some input also. Have fun, and let us know how it works out for you.

Subject: [TS-520_820_530_830] Shottky Diode Mod - Spectrum
Analyzer -Before/After

Hello All,

Since I more or less started this push to install 1N5711 Shottky
diodes after talking with Gordon on 20 meters a while back, I thought
I would try and measure and/or display what exactly was happening with
the receiver. Was the receiver actually quieter because of lower noise
floor with the same sensitivity or was something else at work here.
I have an absolutely stock 830S...Serial number 21XXXXX that I
decided to do a before and after noise level test, (YK-88S1 2.7khz
filter), swapping out the stock 1N60's with the Shottky 1N5711's. I
used a shielded 50 ohm BNC terminator cap off of an old Novell network
as my dummy load to reduce any stray signals. I then used the
calibrate signal to tune a 1khz tone and the AF control to put it
right on the 0dB level on the Spectrum Analyzer program I use. I then
turned off the calibrate signal and let the analyzer program run

simultaneous both a Free and an Average plot for 60 seconds in both tests. I only swapped out the four diodes in the product detector, added the 100 ohm resistor and peaked L19 and L20 for 600mV. No other changes.We know all solid state devices generate noise. Some more than other. After the test I include the 1N60's in the very noisy class. In the jpeg, the blue is the free running audio and the red is the average. You will notice a very obvious spike at about 300hz on both graphs as a reference. There is a pretty dramatic difference. I am open to any ideas as make this a more accurate test. I loaded the resulting jpegs into the files section of the group.

Please see my further post on this subject. We found the procedure in the service manual. If I had seen this, I probably would not have made such of an issue about this.

Perhaps some people can experiment and see what effect this has on the sensitivity and signal/noise ratio. I do not like to see a bandpass filter detuned too far.

Sometimes I worry too much. I am a Taurus and am just too stubborn to do something in a way that I do not fully understand.

I would get hold of Mouser and replace all of the diodes on the rectifier board with 1000V at 2 amp diodes. If they don't have them go for 1000 v 1.5 or 1 amp.
Also, probably on the HV board there are some resistors in series with the screen grid voltage source. Check these and replace if necessary. If this rig has 10 ohm 1 watt cathode resistors like some of the others do, replace them but use only 1 watt or whatever the originals were. I don't have a diagram for the 510. Never heard of it before you got yours. Good find!

Subject: [TS-520_820_530_830] TS-510 Restoration

Another re post of this question but I seem to have missed any reponses.
One of the diode rectifiers in the PS has been replaced. The originals are SE-05's and the replacement is a 1N4004. When I look both of these up on NTEs cross reference I get NTE116 as the cross reference. Can I assume that the 1N4004 is a substitute for the SE-05? All diodes check good with the Ohmeter but am wondering if the SE-05s should be replaced while the PS is dismantled.

Thanks
Barry

Walt
Thanks
I think I will replace all the electrolytics in the PS. As much as possible I will leave the originals physically in place for appearance only and simply mount the new ones under the chassis.
I will replace all diodes in the PS with 1N5408 1000V 3A as I just happen to have a pack of 50 in the tool kit. I also have a pack of 50 1N4007 1000V 1A if there is any advantage to using them.
I have uploaded the TS-510 & PS-510 schematics to the Manuals section and await further guidance on the resistors. BTW the files section is full again.
best regards
Barry

Hi Barry,

Like everyboy's said, why take a chance, relace the old ones. As for putting the new ones in the shells of the old ones - you probably know as well as I do, that it's done mainly for cosmetic reasons, to make the internals look original. Do you want to go to the hassle of cleaning out the old power supply electrolytic shells, so you can put the new caps inside of them, so the 510 "looks original?" Realize that it may be messy, and some of the caps may be oil filled or PCB filled.

73,
Ellen - AF9J

Barry, the gentleman on here that gave me the DigiKey parts numbers gave me this suggestion. Wrap the new capacitors with some pipe insultation like that used on air conditioner piping. Just a small piece at the base of them under the clamp will work.

I am sorry I lost his name from my emails. This was his suggestion how to do it, and it works great. You can find a piece of insulation just the right size to fill the void.

Morning Group,

I'm looking for a FIX VOX X50-1150-00 board for a TS-820. If anyone
has one that is working please let me know including price plus shipping.

Thanks and 73's

Chris my suggestion to you is to go along like you would cleaning your conectors on all the boards and check each one as you go. Make sure each one is connected properly and in it's correct place. Obviously you've cleaned the conacts, but it will eliminate the possibility of a wrong connection to and from each board. That's where I'd start. It's a longer process, but it's a good insurance for that portion of the project by eliminating that much. You might see something else as you go. Take a break before you start separate yourself from the radio with a little time. Let your mind clear and go again later; do it in breaks. A little here a little there. You might see something passing by to something else. I works for me and it has been recomended by others.
Later look at all solder joints with a magnifying glass. Good joints are important as you know at RF. that's my suggestion.

10490. Re: TS-820 FIX VOX X50-1150-00 board

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-22 21:45:19 UTC
From: w5rkl
Topic: 10481 Message: 10490

Hi Joe,

I've been working on my 820, the receive died a couple of weeks or so ago. It all started when the two 10 resistors under the final smoked after replacing the final tubes. Once fixed, the transmitter worked fine but receive sensitivity was way down by 30 to 35db. Calibrator signal was barely readable. I keyed the transmitter again to ensure it was still working into the dummy load and when returning to receive mode, nothing, not a peep from the calibrator and the entire receive was dead.

I cleaned every contact, every switch contact and ensure there were not any burnt and/or broken wires laying loose. All frequency generating circuits such as VCO, Hetrodyne and carrier oscillators plus the VFO are working fine. I've looked at all of them, including the VFO, and they all look good and stable. The digital display shows a solid frequency and changes up and down in frequency by turning the main tuning knob. There is no instability in any of the frequency generating circuits, they all work as designed.

Last week, I injected an 8.830Mhz signal into RIF (Receive IF) pin 1 on the IF board but nothing heard. I figured, at that point, possibly a failed transistor in the IF chain. That was incorrect. I went back to the RF amp board, traced the signal through and still no receive. At that point I thought "All of the transistors couldn't have failed", something I later found out to be a correct assumption, none of them failed, they all work, including the RF and IF system through to the speaker. I know the audio stage is working since I could hear myself through the internal speaker with the MON switch ON. All voltages are within specs.

The other day while cleaning the function switch, I notice if I placed the function switch midway between VFO and VFO R, the receiver worked fine but no transmit. That eliminated the IF, RF amp, all frequency generating circuits as being possible suspected failed circuits. It lead me to believe that possibly the function had failed in one of the sections. Yesterday, I remove the function switch, cleaned it with DeoXit and checked each section, nothing found to be bad. All sections worked as they should and I did not see any broken or pinched wires plus no shorts that shouldn't be there. That eliminated the function switch. I cleaned every plug to every circuit card with no improvement, still dead receiver. With the function switch in the VFO position, correct freqency is indicated on the digital read out and no irregularities when tuning, smooth output on the scope and very stable.

This morning, I was checking connections and pulled the FIX-3 plug from the FIX VOX board, made sure the function switch was in VFO position, not midway between VFO and VFO R, powered up the 820 and noticed the receive came back, somewhat. Although I could hear the calibrator, the bandpass appeared to be very narrow, somewhere around 150hz or less in USB. Placing the mode switch in LSB made the bandpass was much more narrow, something on the order of 120 or less Hz. The 820 does have the CW filter installed so I checked the RIT and IF Shift adjustment on the front panel. Both were in their normal mid position so that wasn't the reason for the narrow bandpass. The ATTEN switch was also checked, it was OFF. This switch was checked previously to ensure it wasn't bad, it checked ok.

Reviewing the schematic in the service manual, it is confusing to know what the 1, 2 or 3 letter designation assigned to each pin on each board are. Some are easy to figure out but other are a guessing game as to what they are and for what purpose they serve.

Since everything else is working, the FIX VOX board appears to be the only possible failure at this point. I do not have access to another 820 to do comparisons. Something is possbily shutting down the IF and/or RF boards and I can't seem to find it. All voltages are good so it's not a voltage source problem. A control signal or control voltage is what I feel is causing the problem. I have not changed any transistors, only some electrolytics on the FIX VOX board. Everything else on the 820 is working properly. If I had another board I could swap and do some voltage checks against the failed board which would give me a much better idea of what is wrong. Since the service manual only has voltages at the some transistors, most of which I can not read. Most voltage indications on the schematics too dark or beyond recognition because of the copy resolution. The manual on Bama is the same except much worse.

As I said, with the function switch midway between VFO and VFO R, the receiver works great. Why the receiver dies in VFO position on the function switch has me stumped.

Do you have a FIX VOX board you would be willing to sell? If so what would you be asking for the board including shipping to zip code 74953?

73's,

Mike

By any chance did you also clean the bandswitch?
Also check the connector towards the right front of the IF board.
I had an issue with mine and had to resolder it. While I was it I
also redid the rest of the connecors.
Another thing check the coupler that connects the bandswitch to the shaft
for cracks. It may be misaligned. Replace if necessary with one from K4EAA.
The replacement is brass the original is plastic and is prone to cracking.

Keep us posted ..... Ruben ..KA2HHB

No it had a 1kc pot hooked from a +9 volt supply on the rf board and
routed up to a term strip on the Filter bd along the edge by the
option filter and a 47k fixed resistor and going to a spot on the
Filter bd point TBL .. This puts a minus 5.6 volts on one of the
Gates of Q2 the tx mixer Fet.in Receive and on TX it +1.8 that is
needed = I dont see this documanted in any of the Manuals and
Schematic s I have.. ???
The little Pot was broken but with it soldered in it looked ok.
Until I unsoldered it all is History now replaced it and bingo
another Good working TS 520

Chris,

With all the help on here, you will get it going again. Rueben is
right about the connectors. I had lany pull right out of the board
when I unplugged some of the cables. Even though they look like they
are seated they may not be making electrical contact. Whe you pull the
boards it is a good idea to resolder all the pins on all the
connectors. I'm sure it is something simple. If the bands where
working before I doubt it is the band switch. Highly unlikely more
than one band would quit at the same time.

Max

10496. Praise for my 830!

Spent some time this weekend working the JARTS RTTY contest on the 830 and had a blast. In my limited time I made 88 contacts on 80, 40, 20 and a few on 15. My strung up 80m longwire at 25' managed to get me into FLA and TX. If you have a narrow CW filter in your rig and haven't done the mod yet, I highly recommend it. Being able to use the 500Hz filter on SSB was great in reducing the QRM. This 830 truly performs just as well or better than my 850 on the receive side. I now only need 7 states for my WAS award.

Hi Max,

I spent some time this weekend in the Jamboree on the Air, mainly on 80 and 40 meters. My TS-830 performed very well and the scouts made some very nice contacts, only Europe. I never had put the rig in so much stress before, but it was a very good testcase. While the Worked All Germany contest was running, I was able to dig out some weak JOTA stations out of the noise. Unfortunately I was unable to work 20 meters and higher, neither was I able to run some RTTY or PSK. Well, some things to work on for next year. Another satisfied Kenwood-customer HI.

Hello my name is Bill ZL3NB and new to the group. I have been a amateur since 1966 originally as WA3GLX. See www.qrz.com/zl3nb for details.

Have owned a Kenwood TS530S since new from 1983 along with the matching SP230 speaker and VFO240 VFO. It was my main station till just 2 years ago when a TS2000 was purchased but still use the "Old Steamer" on a regular basis and on the digital modes where it works like a charm.

The only real problem has been the Band switch but about 5 years ago I fixed it once and for all by removing the Driver Board and resoldering all of the joints from the switch on the board...It's been like new ever since. It's a easy radio to work with and have found under yearly maintenance and alignment they will run perfectly and even out due do some of the newer ones too. These radios have to be considered the "Best of the best" ever made and with the 500 and 270hz CW Filters installed...they're great on cw which is my preferred mode of operation.

73 de Bill ZL3NB

Yes, all voltages are good. I've checked each one from their source
and on every board and found them to be good.

Mike

Subject: Re: [TS-520_820_530_830] TS-830s with low output.

Mac, K4CHS,
I just had a similiar circumstance with my 830s. It was suggested by one
of the members here to replace the two filter capacitors. The exact
replacements are not available, however, I got a couple from DigiKey
that worked just fine.

My HV is back up where it belonged, and I have full output. DigiKey Part
P7448-ND. If they don't have that I thank P7449-ND is the same thing.
Both are 100uf 500 volt.

Here is an update from the weekend. 1. The diode D4 on the vfo board was open so replaced it. Receiver working, 2. Mike your last input was great. The output from the VFO died in spots. Used DE-ox on the tension spring on the verable cap. Three applications and a lot of turning of the cap what a difference. I would never have thought of that.
Now in the process of reinstalling the VFO. Not as easy as it came out. After that try the transmitter then give it a good bath.
73 and thanks all. Wally

I found the problem with the 3 bands dead, Someone in the past of this
radio installed a switch in the back of the radio. They did a very
poor job of install. The wire came out of the plug that they were in.
I am going to talk with my friend and find out what this switch is for.

Probably an old CB mod. Two of the four TS-530S's I presently have were similarly switched/wired for 11m. Had a really frustrating time when I first encountered the back panel switch. It (the stitch) was moved once while housecleaning, and the rig (which before performed flawlessly) was suddenly inop. It's still there, but I intend to remove it at some point.

10507. TS-820 update

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-23 14:51:17 UTC
From: w5rkl
Topic: 10507 Message: 10507

While troubleshooting my TS-820, I took some voltage readings on the "RB" bias voltge control line. The "RB" bias voltage controls both the RF and IF amplifier boards in receive and transmit. I going to take a stab at the meaning of "RB", possibly "Receive Bias" or "Reverse Bias". It really doesn't matter what it means since it's purpose is to "shut down" the receiver in transmit mode. Simply removing the "RB" pin does nothing as you will see by reading the rest of this post.

In receive, a positive voltage of +2.7 to +3 vdc is applied to the "RB" control pins on RF-2 pin 3 (RF amplifier board) and IF-3 pin 1 (IF amplifier board). On the RF amplifier board, RF amplifier buffer Q3 and both receive mixer transistors Q6 and Q7 are biased with a positive voltage, turning them "ON" in receive mode. Also, on the IF amplifier board, the second IF amplifier, Q2, is biased with this same RB positive voltage thereby turning Q2 "ON", also in receive mode.

In transmit mode, however, the "RB" voltage is changed to -2.7 to -3 vdc. This negative voltage is applied to the same transistors, Q3, Q6 and Q7 on the RF amplifier board along with Q2 on the IF amplifier board, turning them "OFF".

My problem is, I have -2.7vdc "RB" control voltage being constantly applied to the "RB" pins on the RF and IF boards whether in transmit or receive mode. Removing the FIX-VOX FIX-3 plug reduces the "RB" voltage to -.08vdc, it never changes in either transmit or receive modes. Replacing FIX-3 plug on the FIX-VOX board causes the "RB" voltage to return to -2.7vdc and this voltage remains at -2.7vdc regardless of transmit or receive. This is the reason the RF and IF boards are, in receive mode, shut down causing no receive.

By moving the function switch midway between VFO and VFO R, the "RB" control voltage switches from -2.7vdc to +2.8vdc allowing the receiver to work. Further movement of the function switch only causes the -2.7 vdc to return, again shutting down the receiver. Following the circuit from the function switch, there are only 2 wafers that switch a "control voltage", wafer 2 and 3 labeled "FS-2" and "FS-3" on the full schematic.

I have verified that "ALL" operating voltages, -6, +5, +9 and +14 volts including the low and high voltages for the driver and final amplifier are present as they should be. The next thing is to find out why the "RB" control voltage is constantly being applying a negative voltage to the RF and IF boards. It is this control voltage that is causing the receiver to be turned "OFF" with the function switch in any position except midway between VFO and VFO R. The function switch is NOT the problem, I've checked each wafer for proper operation and

all four wafers are working properly. I have cleaned the function switch so that's not the problem either, i.e. a dirty switch.

There is a failed component on one of the boards that is causing a constant -2.7vdc to be applied to the "RB" control line. Finding this failed component will more than likely fix the problem.

Removing the plug in the Fix/Vox unit removes the -6v supply and
allows RB (Receive Bias) to float. RB is developed by Q4 in the RF
unit. Start by looking at it. The schematic has the emitter voltages
wrong BTW.

Hi Walt,

I checked the level across the 100 ohm resistor with the sectrum analyzer by first adjusting to 600mV as per AG6K's recommendation and then second peaking it on a weak signal(820mV). I chose a 1.5khz signal using my calibrate marker as it is in the middle of my bandwidth. With the AF control set at minimum, it is at -50dB level.

I observed a definite increase in signal strength level of the tone maximizing L19 and L20 for weak signal compared with just adjusting it for 600mV but the noise floor came up about the same amount...You can see this level change is slightlly higher on the bottom graph. I did not notice any increase in noise or distortion though. If I had to come up with a figure, I would say 2dB...I posted the plots in the photos section. The comparison plot is 600mV on top and 820mV on bottom. I wonder if the 600mV level was arrived at with the original 1N60's as optimum signal to noise and minimum distortion. The much quieter 1N5711's work well with maxing L19 and L20... I left my 830S set for the higher peak. It is much easier to adjust there.

Ellen,

As far as modes go I'm not sure what I have in each mode. I have Wisconsin in PSK. WAS on RTTY might be a nice goal to shoot for. Right now it is mixed mode. I am half way to my DXCC as well. It is amazing how quickly you can accumulate states and countries during a contest weekend!

I'll give that a try Clif. I did notice the voltages on Q4 in the RF amp board. What Kenwood was doing is beyond me. With -C on the base, -13 on the collector and -6 on the emitter, there's no what that transistor would work, it's impossible. So much for voltage readings on the schematic hi hi..

Mike,
What voltages does your schematic show that Q4 should have?
Clif is this the one having the wrong Voltages listed that you are
referring to?

I show the voltages on Q4 RF Board on my schematic to be Base -12.3
(-11.8) Emitter -6 (-6) Collector -4.8 (2.5)

I don't have an 820 here to actually measure at this moment.

Tks Gordon for the suggestion. Unfortunately, R16 on the RF board is
at 4.3k, within 10% specs both ways, up or down.

Clif, Q4 on the RF board appeared to be fine. However, I did change it
with a slightly heaftier NPN transistor and it made no difference,
"RB" still at -2.7vdc on RF and IF boards.

Something is causing the "RB" control voltage to be constant on the RF
and IF boards and Q4 doesn't appear to be the problem.

I'll keep looking.

Walt, I think you mean the relay board (X43-1190-00). The AF-AVR board (X49-1080-00)does not have a relay. Yes I have checked the relay and all contacts are making good continuity check. I even checked the .001ufd disc capacitor across the relay coil and it's good. If it were shorted, the relay wouldn't work, 12vdc direct to ground in transmit. I used a 12VDC power supply to energize the relay and checked both sides, transmit and receive. It's Voodoo magic crawling around in my 820!

Still looking.

Boy I am not sure what this mod was for. It went to the display board,
I took it out and put the wire back were it belongs. Telling me it was
not the band switch was a big help.
Chris..

>
> I checked the level across the 100 ohm resistor with the sectrum
analyzer by first adjusting to 600mV as per AG6K's recommendation and
then second peaking it on a weak signal(820mV). I chose a 1.5khz
signal using my calibrate marker as it is in the middle of my
bandwidth. With the AF control set at minimum, it is at -50dB level.
>
> I observed a definite increase in signal strength level of the
tone maximizing L19 and L20 for weak signal compared with just
adjusting it for 600mV but the noise floor came up about the same
amount...You can see this level change is slightlly higher on the
bottom graph. I did not notice any increase in noise or distortion
though. If I had to come up with a figure, I would say 2dB...I posted
the plots in the photos section. The comparison plot is 600mV on top
and 820mV on bottom. I wonder if the 600mV level was arrived at with
the original 1N60's as optimum signal to noise and minimum distortion.
The much quieter 1N5711's work well with maxing L19 and L20... I left
my 830S set for the higher peak. It is much easier to adjust there.

10521. Re: [TS-520_820_530_830] TS530 Final Board Check

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-23 23:23:36 UTC
From: Rich Jones
Topic: 10507 Message: 10521

First of all Gordon, I received the set of diodes, thank you very much! I am saving them for a snowy day this winter. I feel pretty cheap sending you only two bucks, your packaging a postage more than likely exceed one dollar. I hope to repay the favor some day.
I copied the following:

> Unplug the rig let the high voltage drain and then discharge it.
>
> Check the 10 ohm resistors on the Final Unit board R2 and R3, they are in parallel and should read 5 ohms. They can be measured in the circuit. Also see if they look damaged. Or get new ones at Radio Shack or Fry's and replace them. Use 1 watt only. DO NOT INCREASE THE WATTAGE. They double as a fuse.
>
> Next, look for a choke coil L1 connected to the bottom of the long plate choke. See if this looks fried. DO NOT replace it unless it looks burnt. If you do replace it, you will have to re-neutralize.
>
> On the high voltage unit find R5 and R6. These are 56K ohms 1/2 watt. Also find R-7 this is 12 K They also should be available at Radio Shack or Fry's. They should be replaced as preventative maintenance anyway. The smoke came from somewhere.
>
> Is the power output higher than usual on Tune? If so replacing R5 will fix that.
>
> Now, If you are not experienced in soldering, you can probably get by for now since the rig seems to be working. But if you are able to replace all of these resistors, it would be good preventative maintenance anyway. They are very inexpensive.

Every thing checked out perfect except R-7. Instead of the listed 12K I ohmed out 9.9K. I will replace it soon. Is there in your opinion such a thing as re-neutralizing the finals? Is there an advantage to doing that? I did re-check my bias and noticed it was at 70 VS 60 ma. I re-adjusted it of course. Any advise would be appreciated. I am still blowing 6amp fuses about 5 minutes into a QSO at 50 watts. Thanks, Rich

Greetings to you Bill and welcome to the Kenood group. I'm John-KA3DPW in Parkesburg, Pennsylvania, United States.

I have two TS-830's and digital remote VFO230 with the matchin SP-230 speaker, an MC-50 microphone. Ijust bought a TV-502 to get a feel of VHF. Hopefully I find some resource for cables.I mostly at the persent operate 40 meters when I can.

Wander the archives for the needed information. We have a good set of resources here to meet the needs of the Kenwood tube Hybrids. Also we have people here in the group who come with different approaches to the subjects. So feel free to put an issue out that you need help with. There are others around with 530's here.

Some with repair shops, some you'lll find are considered guru's and in between various people with knowledges and experiences similar to what you will encounter yourself. You'll often find a question is raised and a number responses return back.

We also have sister groups. The Kenwood mics and Kenwood QSO's. We have been trying to get a net going her recently.

So join in the mix. Watch and you learn alot.
Bill <zl3nb@...> wrote:
Hello my name is Bill ZL3NB and new to the group. I have been a amateur since 1966 originally as WA3GLX. See www.qrz.com/zl3nb for details.

Have owned a Kenwood TS530S since new from 1983 along with the matching SP230 speaker and VFO240 VFO. It was my main station till just 2 years ago when a TS2000 was purchased but still use the "Old Steamer" on a regular basis and on the digital modes where it works like a charm.

The only real problem has been the Band switch but about 5 years ago I fixed it once and for all by removing the Driver Board and resoldering all of the joints from the switch on the board...It's been like new ever since. It's a easy radio to work with and have found under yearly maintenance and alignment they will run perfectly and even out due do some of the newer ones too. These radios have to be considered the "Best of the best" ever made and with the 500 and 270hz CW Filters installed...they're great on cw which is my preferred mode of operation.

Tnx for the welcome John. I lived many years up in Pottstown, home of the 147.21 machine prior to moving here in 86...Used to go through the WA3GMS Repeater on 147.195 (not sure if its still there or not)...

Yes looks like a good site as have been going back through some of the threads and the files.

Ill put together a list of littel quirks and fixes I have done on my TS530S over the years in due course Although one interesting item that comes up in the threads is Deoxit for the bandswitch. I used to use the standard CRC "CO" contact cleaner till they changed the chemicals in it and made it harmful to many plastics...Important to read "Warnings" on those cans as I knew one guy who used and it crack the waffer switch in the receiver of the switch! But ordinary contact cleaner is dry and in the end really does not solve or do the job right.

I found using CRC 5-56 a marine grade type good for both mechnical and electical use...That worked really great since not only did it cleaned the contacts but left a lubicating residue on them but the main culprit in the end was the solder joints where the switches go the driver board and that shaft coupler (inside the final compartment)...

My experience from those products is that I worked in the Elevator trade as a Electrican/Electronic Tech for many moons.

Hi John,

Yes the VFO is working just fine, in fact I use it for tuning the rig instead of the 830's VFO! I use an R7 on 40-10m on the longwire on 75/80m. Not the best setup but it does get me on the band. I don't venture down on 75m until winter time.

Max

I think I answered one of my own questions by reading Walts file article on neutrailzing 6146 tubes.....

If you are installing new tubes or if the neutralization is considerably out.....Thanks for the great info in the archive files. Rich

Rich Jones <michjonezee@...> wrote:

First of all Gordon, I received the set of diodes, thank you very much! I am saving them for a snowy day this winter. I feel pretty cheap sending you only two bucks, your packaging a postage more than likely exceed one dollar. I hope to repay the favor some day.
I copied the following:

> Unplug the rig let the high voltage drain and then discharge it.
>
> Check the 10 ohm resistors on the Final Unit board R2 and R3, they are in parallel and should read 5 ohms. They can be measured in the circuit. Also see if they look damaged. Or get new ones at Radio Shack or Fry's and replace them. Use 1 watt only. DO NOT INCREASE THE WATTAGE. They double as a fuse.
>
> Next, look for a choke coil L1 connected to the bottom of the long plate choke. See if this looks fried. DO NOT replace it unless it looks burnt. If you do replace it, you will have to re-neutralize.
>
> On the high voltage unit find R5 and R6. These are 56K ohms 1/2 watt. Also find R-7 this is 12 K They also should be available at Radio Shack or Fry's. They should be replaced as preventative maintenance anyway. The smoke came from somewhere.
>
> Is the power output higher than usual on Tune? If so replacing R5 will fix that.
>
> Now, If you are not experienced in soldering, you can probably get by for now since the rig seems to be working. But if you are able to replace all of these resistors, it would be good preventative maintenance anyway. They are very inexpensive.

Every thing checked out perfect except R-7. Instead of the listed 12K I ohmed out 9.9K. I will replace it soon. Is there in your opinion such a thing as re-neutralizing the finals? Is there an advantage to doing that? I did re-check my bias and noticed it was at 70 VS 60 ma. I re-adjusted it of course. Any advise would be appreciated. I am still blowing 6amp fuses about 5 minutes into a QSO at 50 watts. Thanks, Rich

Nice to meet you Bill. I too am new to the group and it is fast becomming a ritual to daily read the posts and comments. Many have already been very helpful for me, I don't know how I surevied all these years without a computer. Any way, I too have gone the CRC route and of course whatever it was made of did no harm to my old Drake TR4 and TR4C equipment. You are however correct about the plastic issue. I have since switched to a product called Deox-Id. More than like a close of the Doxite. Either way you must take care with the Napha ingrediants in regards to venting. I have a TS530 on the bench now, I am blowing fuses about 5 mintues into a QSO. I will be ohming out the final filiments from info gleaned from a file article. More than like it will be my culprit. Take care and hope to hear from you again soon. Rich KG7FS

10536. 820 is working!!!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-24 06:56:28 UTC
From: w5rkl
Topic: 10536 Message: 10536

This evening I decided to perform some more indept continuity checks from the function switch center wiper, through the control and voltage paths to their destinations on the various boards. Everything seem to check fine. The checks were performed using a wire connected to the VOM probes and pushed down in each boards plug wiring pin. The only check I couldn't do that with was the calibrator, the pins are either soldered or wire wrapped. Once I was satisified that all function switch center wipers had been checked good with every wafer pin and wiring path, I removed all the meter leads and wiring.

Just for grins, I moved some of the wiring on the bottom rear of the chassis in the event one or more of them were shorted to ground etc. I had done that before with no change in symptoms. I made sure every plug and the relay was back in its socket, pins 8 and 9 on the rear 9 pin VFO socket were shorted and powered up the 820. The receiver came right up with lots of audio.

I let the receiver run for a while, tuning around 40 meter CW band. I decided to tune the 8.830Mhz traps, L24 and L25 on the coil pack. Injected an 8.830Mhz signal at the so-239 and adjusted L24 and L25, 4 or 5 times to ensure minimum S meter reading then injected a 7.150Mhz signal and adjusted the antenna and mixer coils on the coil pack board. I noticed the sensitivity was a bit low, about 15 db. Why this is I'm not sure at this point. For now, I'm happy the receiver is working like it should. I tuned up the transmitter which needs the driver tuned since I can only get about 85 watts on 40 meters. I haven't tried the other bands yet but I'm sure adjusting the driver coils on the coil pack board will increase the output to 100 watts. The 820 has a new matched set of finals and neutralization doesn't appear, at this point, to be needed.

So, what good came from this? The following are some of my thoughts on the subject. First, I found the TS-820 is a very well built and designed transceiver except for those plastic board plugs and pins. I don't think much of Kenwoods circuit discription and schematic either. However, all that said, the following is a summary of what I believe to be important troubleshooting techniques on an 820.

1. Do not rely on a voltage reading by pushing a meter lead into the boards plug. The wire may show a voltage but does the board see the voltage? In this case, now it didn't.

2. Verify all voltage, +5, -6, +9 and +14 and 14A along with -C, and that they are at the source and also the destination, on the board not just the plug itself. On the board can be checked by placing the volt meter on the boards pin and a ajacent component leading to that pin.

You may need to scrape some paint off the component lead to make the measurement. Also check the low and high voltages for the driver and final amplifier at the source and destination. If they are at the source but not at the destination, there's either a shorted wire to ground which should have either blown the fuse or cause a visual indication you can see. If there isn't a short then there is a broken wire in the wiring harness more than likely. A few visual indication examples are no lights (check them for continuity with an ohm mete), one or more LEDs do not illuminate or functions/modes don't work.

3. If the transmitter is working fine and the display is stable and follows the main tuning knob without jumping around, then you can be satified that ALL frequency generating circuits are working. What about the receiver you may ask? The receiver uses the same frequency generating circuits the transmitter does. That means the VCO, PLL, VFO (both internal and external), hetrodyne and carrier oscillators are used in transmit as well as receive. The 820 is a single conversion system and the frequency generating circuits run continuously and are diode and relay switched by voltages from receive to transmit and back. So if one or the other modes, transmit or receive, is working only clean the board contacts and leave the adjustments alone. Like they say, "If it ain't broke, no fix it" or you'll create more problems.

4. Don't relay on the schematic voltage readings, check them yourself. There are a number of errors on the schematic and PC foil diagrams. Some erros are jumper and foil side resistors are shown on the foil diagram in the service manual but are not in the radio. Why this is I'm not sure. More than likely, a later version of the radio. Most likely serial number versions. I found a number of these errors in my 820. The voltages should be checked in the RF amp. As Clif pointed out and I saw it myself, the RF amp board has incorrect voltage reading on Q4. Q4 is an NPN transistor and if you look on the schematic, you will notice the collector has -13 volts, the base has -C and the emitter has -6 volts. Now an NPN or a PNP will NEVER work with all positive or all negative voltages applied to the collector, base and emitter. So check the voltages to be absolutely sure.

5. Do not rely simply on cleaning a switch. That can, with intermittent problems in a switch, clear up a problem. However, in this case, it did absolutely nothing but clean the switch. Do not dismantle the switch, you will be sorry if you do. No I didn't do that. Instead, I performed an indept continuity check throughout the circuit to ensure the switch is good. I found out that simply removing the switch from the front panel just to check it was a waste of time. The entire switch can be thoroughly checked including the wiring that connects to the swith without removing the switch from the front panel. Simply look at the BIG schematic, follow the wiring and use an anologe Ohm meter to check the switch. Pay attention to what you see on the schematic, the switch must be viewed from the otherside of the page, like your looking at the schematic from the back side of the paper. Failure to do this will give you a wrong or misleading reading

from what the schematic shows.

6. Look at the biasing voltages that turn circuits on and off. If the voltage is consistant keeping a circuit turned off when you know it should be on, look at the wiring, you most likely have an "OPEN" somewhere on another control voltage that affects the one you're looking at. What gave me that idea was, the receiver worked like a champ if I put the function switch midway between VFO and VFO R. There had to be an open somewhere and that's the reason I did the indepth continuity check this evening.

These are only a few things that I wanted to pass on to everyone working on an 820. Although the 520 is similiar, there are alot of difference but if you are persistant, you will find the problem. Take alot of breaks, the constant troubleshooting can tire you out and cause you do "repeat" steps you do not need to do. Only repeat a step if you are unsure of the results. Above all, take you time and learn something from your troubleshooting experience. One last thing. While you have each circuit board out, clean every interconnecting pin with DeoXit especially the PLL, Hetrodyne and carrier oscillator boards. You'll thank yourself later as these are problematic causing the VFO to jump around. Don't forget the VFO, clean the variable capacitors shaft tension spring contact point, again, you'll thank yourself as this too is an area of instability in the VFO.

I applogize for being so long but this problem was a real bugger. I can not say with any certainty that you will experience the same result I did if you have a similiar problem. I can only pass on to you some helpful information on troubleshooting a TS-820/820(S). By the way, the only difference between an 820 and and 820(s) is the digital read out. Everything else is the same, or so it seems, or does it?

73's,

Mike

Date: 2006-10-24 10:15:33 UTC
From: David Rust
Topic: 10538 Message: 10539

Greg, my S meter on my 530s reads about an S9 with the calibrator turned on. My 830S just the last couple days hardly reads at all, and in the AGC position on transmit just sits on the peg. I know the radio is working ok, I am getting the usual voice peaks on my antenna tuner/watt meter. So I probably have the same problem as you with the S/AGC meter position. I havent dug into this problem yet, I was going to start with a good Deoxit cleaning on everything, including the relay.

Hi Chris

When I first got my TS830, I too got tricked when I released the Noise Blanker switch and suddenly lost 3 bands.
In my case the noise blanker switch was wired on permanently, and the switch re used for another purpose.
The modification allows operation on 27MHz, by selecting the 29MHz band and throwing the switch.
However you still have to mentally subtract 2 MHz of the frequency displayed. A crude mod, but effective.
The switch is in the closed position for normal operation, and open for 27MHz.
The modification is easily reversed, and should be done for originality.

Joe
The NTE cross reference lists this as a common rectifier diode rated
at 600V 1A (NTE 116)
The following should do the job
1N4005 600V 1A
1N4006 800V 1A
1N4007 1000V 1A
regards
Barry

Topic: 10538 Message: 10542

I calibrated my S-meter to read S-9 with 50 uV to the antenna terminal (from Elecraft XG2 generator). The 25 KHz calibrator reads about S-8.5 IIRC. I get the most deflection in CW-W with the VBT at it's widest, and less at the narrow bandwidth settings.

- Keith KD1E -

-----Original Message-----
From: Greg

Can someone pls check and tell me if your s-meter deflects when the 25 Khz alignment tone is on? Should I get a full scale deflection, assuming AGC is on either slow or fast?

Chris.

This was almost a year ago so I don't remember much detail. I think that a wire had been cut just after it came out of a plug, and this was located just toward the front of the radio from center. The switch was wired to the two cut ends of the wire, and either opened them or reconnected them. All I did was remove the switch and extra wiring, and solder the original wires back togather and the display worked normally. Sorry I didn't document the details of what I found.

Just saw this on eham this morning:

10/24/06
AB8JN
HF Radios

Kenwood TS 830S

Kenwood TS 830S Gold. Appearance is a 7+. Has the
WARC bandas. This unit has low output. I dont
have the time to work on it. It has one TRIO
ssb filter installed. No manual or mic-just
the radio. The radio has been sitting idle for
the last five years. It was a backup rig only.

$295.00. You pay shipping. 586-549-3604

Just passing it along FWIW.

Hi Chris.

Here is some details I found in an old posting back in May.
"I followed the NB switch wires and it appears to break the R62 (pin 2
of plug C) lead on the PLL board. "

My switch definetly did not go to the display, but maybe it is a way of
correcting the 2 MHz offset I mentioned earlier.
Maybe the group can answer this. For those familiar with the CB
modification, does the display actually display 27 MHz or 29 MHz.
I am half suspecting that there maybe 2 parts to the mod.
1. Trick the PLL.
2. Correct the display offset.
If I am correct, then I'd say, my TS-830 never had the 2nd mod. fitted,
and that you may still be missing 3 bands even when you remove your
modification.
Chris can you confirm if your bands are restored just by removing the
display mod?
If it does not, check all switches for functionality, because maybe
someone has used one of the original switches to trick the PLL.
There is of coarse the other possibility that different modifications
can achieve the same result. It's a funny saying but "There is more than
one way to skin a cat".
Let us know how you go.

Hi Walt,

When I peaked L19, the signal came up a bit. The service manual say to adjust L20 counterclockwise so I turned L20 1/4 turn clockwise and then back counterclockwise until the signal peaked and the level came up even more. I went back a forth a couple times peakinig the signal. When I turned off the calibrate signal, I checked the RF VTVM and it checked .293V on both LSB/USB...If I convert correctly, that is 820mV p-p....That is within the 1dB specified by the service manual. I can't detect any distortion on my spectrum analyzer software doing it this way and the recovered audio sounds fine. I am going to check my other 830S when I have time.... I wish someone with better test equipment could compare these settings.

I don't know if there is something I am missing doing it this way but it seems too easy. The 600mV level is very tedious to set. This way takes less than 30 seconds.

Considering that it's low output, could just be bad finals, a wimpy driver tube, mistuned band coil packs, or a weak VFO, it might be worth pursuing for $295.

Ellen, I bought an 830s in VERY nice condition with low output from a reputable dealer for $250. They also told me what was wrong with it, however, wasn't that at all. Needed new filter capacitors. I installed that and away it went, now I have an S/AGC problem, shouldn't be too hard to remedy, in fact I may be responsible for that. I adjusted it a few days ago with the calibrator on and may have not set it correctly.

A year ago I bought a nice 830s for a smidge under $300 IIRC. No CW filters, but very clean, SN 7xxxxxx with the manual. Worked 100%, full output, one bulb burned out and a swapped in 3 prong power cord.

The one I have now cost me $375 with 2 CW filters, full output, everything working FB, SN 4xxxxxx.

I'm thinking $300 for one with weak output is just a tad high unless the rest of it is in exceptional shape.

I've been lurking here since I bought a "great condition" - so said the ad - TS-830S Gold for $325, from the seller's friend's estate. I don't have it yet, it's on its way. I hope it's as described...

This is going to be my first TS-830 (I have another hybrid, and old National NCX-1000) - I'm basically a "boatanchor" person... My most modern rig is a TS-480SAT which I'm using on MARS.

What I managed to find out about the TS-830 Gold version is (besides the label" that it should have all the filter options factory installed.

Meir,
That is NOT true about the Gold having all the filters factory
installed. I have owned two of them, both from the original owners, one
did have all the filters installed. It was obvious that the other
never had !
The ONLY difference I have found on the gold and the Silver is, The gold
has the Gold Label and 1 meter lamp, while the silver had the silver
label and 2 meter lamps..
Where did you hear that information ?

73,
Gordon

I just spoke to the fellow with the TS830 Gold. I offered him $250 sight unseen but he is firm on the $295.00. From speaking with him I don't think he has used it much. He has an Icom 746 Pro that he has been using for some time. I asked him if he check or changed out the 12BY7 and he said no but he had one and would try it out. Everything sounds up and up. I didn't know about the "all filters" in a Gold version. Thank would add at least a hundred and 25 bucks to any rig's value. You all go for it if you want, it will be interesting to see what ends up happening. Rich KG7FS

TS-830S Gold for $325, from the seller's friend's estate. I don't have it yet, it's on its way. I hope it's as described...

This is going to be my first TS-830 (I have another hybrid, and old National NCX-1000) - I'm basically a "boatanchor" person... My most modern rig is a TS-480SAT which I'm using on MARS.

What I managed to find out about the TS-830 Gold version is (besides the label" that it should have all the filter options factory installed.

Good afternoon everyone. I figured I should post an update to let everyone know how this project has been going.

Walt - I apologize for not replying to your previous post. I just overlooked it until I sat down to write this reply.

I have the rig on the air and just made a contact on 40 meters with it. It is certainly usable now. Audio and signal reports were favorable with nothing objectionable noted. I have a couple of questions that I will pose to the group in a moment.

Here is all that comes to mind about what I did to try to get this rig operational again. I thoroughly checked all of the components on the rectifier board as one person suggested. I found nearly all of the carbon comp resistors on that board were out of specification. Most were probably within range of what would be expected given their age. I found one of the 470K resistors was completely out of range. I wish I was able to tell everyone exactly which one it was. As I said before, nearly all of them were outside of the stated tolerance. After finding that, I just started removing them from the board and throwing them in a pile. I had decided to replace all of the resistors on the board. Once I had them all in a pile, I began checking them again. That is when I found one that checked way high. Again, I don't know which position it came from. I can only say that the markings indicated it was one that should have been 470K.

I found that the cathode resistors I had previously replaced were up around 30 ohms now. I replaced those again.

Several of the .047 ceramic disk caps on the final board looked as if the edges were eroding away. I'm not sure if that was from physical wear from me having the board in and out so much or from an electrical problem. They did not appear to have been overheated and were not shorted. In any event, I replaced all of them that appeared suspect.

I also began to wonder if my "new" tubes may, in an unlikely coincidence, be bad. I swapped them out with another old set that I had (not the same set that were installed when this problem first occurred).

I checked final output relay and found the contacts on one side were pitted. Each side exhibited some resistance. I cleaned the contacts and resolved that problem.

That's all that I can think of right now in the way of changing things.

I realize that the way I went about this makes it difficult to isolate exactly what the problem was, but I was getting a little frustrated with this rig and about ready to stick it on the shelf.

I fired it up and things seemed to check out reasonably well. I neutralized the tubes and gave things a final check.

This leads me to my only remaining issue with regard to the transmitter section...

When tuning the transmitter, I find that the plate current is up around 260mA after dipping it, if I have the load control set for maximum RF out (about 115 watts). If I reduce the load control so that the RF is about 100 watts, the plate current is about 240mA.

I think that is still a shade higher than what it should be. I was looking for something down near 225mA. My understanding of the tuning proceedure is that I should increase the load control to the point of maximum RF while periodically dipping the plate current during the process.

Is 260mA unacceptable? If so, is there any harm in reducing the load control to bring the plate current down some.

I should mention that I obtained all of these figures on 40 meters. I have not tried loading it on other bands yet.

Thanks to everyone who offered assistance to me on this project. I appreciate your time and effort. I may not have everything completely fixed, but at least the rig is usable now.

The issue with no TX and weak RX on the 28Mhz position still exists, and after looking at things while spending so much time with this rig, I think that is the result of a botched 11 meter mod. I may wrestle with that at a later time.

What are your thoughts on the level of plate current? In the mean time, I'll check it on other bands and see what I come up with.

Kevin

Topic: 10538 Message: 10565

My S meter does not always have the same reading. To calibrate the S meter on an 820, follow the procedures outlined in the service manual. This procedure is not in the operators manual. The S meter zero adjustment is on the 820's IF board and requires 3 adjustments on 3 different components. You can't use the onboard calibrator to properly adjust the S meter. You need a signal generator. The signal needs to be adjusted to a certain level and the onboard calibrator can not be adjusted low enough to do the adjustment properly. If you use the onboard calibrator your S meter readings will be incorrect.

On the average, my onboard calibrator provides a reading around S8.

I own one of each and the only difference is the meter lighting.
I paid $366.00 for the "silver" TS830S which came with the SP230 speaker an MC50 mic and a PC1 Phone Patch.
The guy was not a ham, didn't know what he had. So $325.00 is about right for a working rig in my opinion.
I feel I lucked out.

Meir,
That is NOT true about the Gold having all the filters factory
installed. I have owned two of them, both from the original owners, one
did have all the filters installed. It was obvious that the other
never had !
The ONLY difference I have found on the gold and the Silver is, The gold
has the Gold Label and 1 meter lamp, while the silver had the silver
label and 2 meter lamps..
Where did you hear that information ?

73,
Gordon

Ok I saw it passing thru a web site looking for transverter info. I hadn't seen it before and I've wanted a way to reduce power to drive my linear for side band. I thought I'd see if there was interest in the group. If so I'd go hunt it down again.I hadn't seen it passing thru before. So I mentioned it. Thenks for telling me.

james27613 <james27613@...> wrote: hi john,

we have this info here in the MODS folder in files section,

Use ALC input to 'force' QRP operation.jpg

I'm not the author but I did pass this on to the list.

Outta my reach right now. I'm occupied enough with the transverter and 830 projects, but thanks.

Well I found it on a web page passing thru looking for information for my transverter. I mentioned it and James told me it's in the archives already. The web page mentioned it was on a TS-830. So it mey work on our 830's. I need one to reduce the drive to my linear. Maybe it's best to ask Gordon or Walt, or ask around. We all like these topics.

As Gordon says, one verses two meter lamps and the color of the 830
marking below the knob. That's it. The "all filter factory installed"
myth is as old as the 830 itself. I just got an 830 that has neither the
gold or silver TS-830 marking. It's been removed and in its place is a
Dymo label that says "Boss Man". I can see the big $$ now.

10571. 820 sensitivity problem fixed

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-25 00:14:59 UTC
From: w5rkl
Topic: 10571 Message: 10571

The 820's low receiver sensitivity turned out to be an incorrectly adjusted S meter. Peforming the S meter calibration, as outlined in the service manual, made a huge difference. This evening while tuning around on 40 meters I ran across a station in NY with a 45 over 9 signal. I quickly brought my FT-857D on line and compared. He was only slightly higher in S meter reading on the 857D, about 1 S unit difference. Not bad for a 30+ year old radio.

I want to thank everyone for their suggestions during the troubleshooting of my 820. Each and everyone was great apprecaited. That's what this group's all about, providing help and sharing information. Thanks again everyone.

73's,

Mike

Yes the 985 machine is still there. It is only a few doors down the road from me. Joe Fell still has the repeater and also has a 220 on the same site and 442. The former owner of the property Bill Findley W3FEA passed away a whole back and his widow wants to sell the place. The machine is visited mostly by the frogs, friday nighters, and is takes part in CCARS (Chester County Amateur Radio Services). It's a combination group of ARES and RACES. I can reach your old 147.195 machine from here too. IN fact I can simplex to Harrisburg and Lancaster from here. Elevation 940 feet with nthing else around for miles as high as this. That's why I want to see what VHF is like, more so than just FM.
I used CO Contact Spray recently on my 830 and found it made a haze in my relay cover. I had my linear upside down on the bench with the top still on and it softened the paint. I used it years ago and didn't have this problem. Now I know why. Thanks.

Bill <zl3nb@...> wrote:
Tnx for the welcome John. I lived many years up in Pottstown, home
of the 147.21 machine prior to moving here in 86...Used to go
through the WA3GMS Repeater on 147.195 (not sure if its still there
or not)...

Yes looks like a good site as have been going back through some of
the threads and the files.

Ill put together a list of littel quirks and fixes I have done on my
TS530S over the years in due course Although one interesting item
that comes up in the threads is Deoxit for the bandswitch. I used
to use the standard CRC "CO" contact cleaner till they changed the
chemicals in it and made it harmful to many plastics...Important to
read "Warnings" on those cans as I knew one guy who used and it
crack the waffer switch in the receiver of the switch! But ordinary
contact cleaner is dry and in the end really does not solve or do
the job right.

I found using CRC 5-56 a marine grade type good for both mechnical
and electical use...That worked really great since not only did it
cleaned the contacts but left a lubicating residue on them but the
main culprit in the end was the solder joints where the switches go
the driver board and that shaft coupler (inside the final
compartment)...

My experience from those products is that I worked in the Elevator
trade as a Electrican/Electronic Tech for many moons.

hi scott,

The qrp mod in the files section will work with
the 520 or 820.

For the 530/830 you need to use the smaller DIN plug,
double check your manual before you wire it up.

I have made one for my 520 and 530, 9v alkaline
will last a long time, or use the lithium for years of QRP !

some use the mic gain to lower the ouput but this can
cause poor signal so for long term use not good idea.

(I posted the mod, but I am not the author)

I like to use mine to hold 4 or 5 frequencies I scan. I float alot. Find a quiet spot and Start CQ and before long somebody shows up. I can keep monitoring the other spots in the meantime. My End fed was a quarterwave on 160 at the same height with several 40 quarterwaves in the ground under it in different directions. This year I'll run the vertical on 80 this winter. Maybe fold it down and add some wire and make it longer to a tree for 160. I can tune 160 3:1SWR with my Versa Tuner but it's not the best.
I had RF in the shack with my end fed. Now I'm thinking of lengthening it tothe end of the property and bringing it down lower for a Beverage. It's not far off for Europe. I figure 200 feet's better than nothing.
17 is really good with the vertical. It's 5/8 wave there.

till I built the vertical.

Hi John,

Yes the VFO is working just fine, in fact I use it for tuning the rig
instead of the 830's VFO! I use an R7 on 40-10m on the longwire on
75/80m. Not the best setup but it does get me on the band. I don't
venture down on 75m until winter time.

Doesn't suprise me tho. If you keep the contacts clean and in good shape, these radios perform like that. That's why I bought a second 830 after 25 years of the first.

w5rkl <w5rkl@...> wrote:
The 820's low receiver sensitivity turned out to be an incorrectly
adjusted S meter. Peforming the S meter calibration, as outlined in
the service manual, made a huge difference. This evening while tuning
around on 40 meters I ran across a station in NY with a 45 over 9
signal. I quickly brought my FT-857D on line and compared. He was only
slightly higher in S meter reading on the 857D, about 1 S unit
difference. Not bad for a 30+ year old radio.

I want to thank everyone for their suggestions during the
troubleshooting of my 820. Each and everyone was great apprecaited.
That's what this group's all about, providing help and sharing
information. Thanks again everyone.

Gordon,

When I corresponded with the seller and he told me it was a GOLD model, I had no idea what the difference was, then I Googled TS-830 GOLD and it came up with a source which said that it had all the filter options.
Maybe it was incorrect, and I appreciate the correct information. As it is, the seller said it had both 500 Hz filters in.

Meir,
That is NOT true about the Gold having all the filters factory installed. I have owned two of them, both from the original owners, one did have all the filters installed. It was obvious that the other never had !
The ONLY difference I have found on the gold and the Silver is, The gold has the Gold Label and 1 meter lamp, while the silver had the silver label and 2 meter lamps..
Where did you hear that information ?

73,
Gordon

10582. Zorched Circuit Boards

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-25 04:07:03 UTC
From: Max Harelik
Topic: 10582 Message: 10582

From time to time, I see issues/problems discussed that focus on deteriorated/damaged/burned circuit boards. For example, two that affect Kenwood hybrid radio owners often are the RF Power Amplifier board and the Power Supply board. Generally, the solution is refurbishing existing runs and solder connections, but sometimes requiring patching in wires to replace runs that are beyond recovery.

My question is this: Does there exist anywhere a library of radio circuit board masks, such that a graphic of the board mask could be downloaded and used (perhaps through some of the circuit board fabricators discussed in earlier messages) to create a new replacement board?

There are obviously copywrite and patent issues that potentially apply. But, in the case of thirty-year-old radios such as the hybrids, this is not likely to be a problem. And, there are examples of board replacement (usually in the form of modification kits) in today's radio market. The one that comes immediately to mind is Harbach's Heathkit SB-200 Power Supply board (and components), which I built and installed in my own amplifier.

I see potential for such a library, particularly for those of us that like to work with older radio equipment of whatever brand/manufacture. So, does anyone know of such a service/library? Anybody interested?

Subject: Re: [TS-520_820_530_830] Shottky Diode Mod - Spectrum Analyzer -Before/After

Hi Walt,

When I peaked L19, the signal came up a bit. The service manual say to adjust L20 counterclockwise so I turned L20 1/4 turn clockwise and then back counterclockwise until the signal peaked and the level came up even more. I went back a forth a couple times peakinig the signal. When I turned off the calibrate signal, I checked the RF VTVM and it checked .293V on both LSB/USB...If I convert correctly, that is 820mV p-p....That is within the 1dB specified by the service manual. I can't detect any distortion on my spectrum analyzer software doing it this way and the recovered audio sounds fine. I am going to check my other 830S when I have time.... I wish someone with better test equipment could compare these settings.

I don't know if there is something I am missing doing it this way but it seems too easy. The 600mV level is very tedious to set. This way takes less than 30 seconds.

Rick KC0HH

If you are talking about the mod that puts voltage into the ALC port, I think it will work for the 520,820,530, and 830.

There is also a method for reducing the output to around 30 to 40 W PEP for driving a low drive amp such as a Collins Thirty S. One. It involves placing a 12 K resistor in series with the wire that feeds the SG point on the final board to lower the screen voltage. It will not bring the power as low as the mod using the ALC voltage however.

Topic: 10441 Message: 10587

As I understand, the later SN rigs had improved IF filters making them more desirable than the earlier SN rigs. If the change over happened around 3 mil, then all the silver label and some of the gold label rigs are using the less desirable filters, right?

And as I understood it, it wasn't a Gold Edition, but simply a Gold Label model. I don't think Kenwood ever marketed them as anything other than 830s transceivers. The used market & e-bay have amplified this gold label issue way out of proportion.

Maybe I should sell my gold label model, buy an older silver label model and put the spare cash into other gear?

James is right. This is a standard mod for QRP phone work with tube rigs. Lowering mic gain often results in lousy sounding audio. For QRP CW work, it's even easier, just turn down the carrier level control to the desired output level, after tuneup. I've done QRP for over 20 years, and some of my earliest QRP operating, was done at 2W out, on 15m CW, with the TS-830S at the Univ. of WI club stattion (W9YT), back in the mid 80s. Have fun.

73,
Ellen - AF9J

P.S. - as far as I know, there aren't any dedicated Kenwood QRP groups, in spite of the fact that the TS-130V (the QRP version of the TS-130), has become a classic, and much sought after QRP rig.

I think that you will find that he purchased the rig with this mod and was trying to de modify it.

I understand that. My post was referring to what the previous guy had done to modify the rig. I bought one years ago off Ebay that had been CB'd. I still say its sad that someone does that to a perfectly good radio.

So what I'm building is a box for the battery, pot, and cable
connections. I see the Kenwood cables on Ebay all the time, and as
long as I get the right pins in use I should be ok. I might be
asking some more questions soon, but for now that's the info I need.

Thanks for all the help.

830M's were also marketed outside the U.S. There's also nothing in the 830S "gold" and "silver" brochures that indicates there were any "improved" filters being marketed by Kenwood. The "improved" filters most were talking about were the after market filters marketed by International Radio(the original one in FL).

Hello,

I don't know if they are 'improved' filters but Kenwood changed the
stock 8.83 filter from YK-88S(2.4khz)to the YK-88S1(2.7 khz)early on
in the 830S' and then changed the 455khz Murata ceramic CFJ455K5 to
the CFJ455K12 around the 3 mil serial number.

They also seem to have more variations of S meter lamps as I have
two Silver and one Gold all with a single lamp.

The improved filters I'm talking about are those that have been discussed on this list. That after about SN 3xxxxxx, Kenwood did a production change on the filters to something a little better (-12 version vs. -5??). It would have been considered just a part substitution by Kenwood and would not have been advertised.

Unless I've read the posts to this list wrong (entirely possible)

Apparantly somewhere around the 3 mil serial number, Kenwood replaced the stock 455 IF filter. Filters were marked either CF455K5 or CF455K12. Mine is a 2 mil unit with the K5 filter in it. According to the service manual this filter has a 2.7 Khz B/W while the K12 is 3.2 wide. I would suspect this as being true, as my rx B/W is just under 3K and I have a 3K 8.83 IF filter in mine. Mine also has the 500 hz CW filter in the 8.83 IF. And it only has one meter lamp. I hope everyone is as confused as I am. I don't plan on selling it, so as long as the receiver comes to life when I flip the power switch I couldn't care less whether it is a gold, silver or polk-a-dot. I would love to have AM on it htough.

Analyzer -Before/After

Hi Walt,

When I peaked L19, the signal came up a bit. The service manual say to
adjust L20 counterclockwise so I turned L20 1/4 turn clockwise and then back
counterclockwise until the signal peaked and the level came up even more. I
went back a forth a couple times peakinig the signal. When I turned off the
calibrate signal, I checked the RF VTVM and it checked .293V on both
LSB/USB...If I convert correctly, that is 820mV p-p....That is within the
1dB specified by the service manual. I can't detect any distortion on my
spectrum analyzer software doing it this way and the recovered audio sounds
fine. I am going to check my other 830S when I have time.... I wish someone
with better test equipment could compare these settings.

I don't know if there is something I am missing doing it this way but it
seems too easy. The 600mV level is very tedious to set. This way takes less
than 30 seconds.

I don't know of one. To copy a board would take some time. You could try Kenwood Corporation, I just emailed there again not to long ago for my transverter. I wouldn't hold my breath waiting, but it's a shot in the dark. I'm working the transverter project right now. That's got my time at the moment. That and leaves.

Max Harelik <mharelik@...> wrote: From time to time, I see issues/problems discussed that focus on
deteriorated/damaged/burned circuit boards. For example, two that affect Kenwood hybrid radio owners often are the RF Power Amplifier board and the Power Supply board. Generally, the solution is refurbishing existing runs and solder connections, but sometimes requiring patching in wires to replace runs that are beyond recovery.

My question is this: Does there exist anywhere a library of radio circuit board masks, such that a graphic of the board mask could be downloaded and used (perhaps through some of the circuit board fabricators discussed in earlier messages) to create a new replacement board?

There are obviously copywrite and patent issues that potentially apply. But, in the case of thirty-year-old radios such as the hybrids, this is not likely to be a problem. And, there are examples of board replacement (usually in the form of modification kits) in today's radio market. The one that comes immediately to mind is Harbach's Heathkit SB-200 Power Supply board (and components), which I built and installed in my own amplifier.

I see potential for such a library, particularly for those of us that like to work with older radio equipment of whatever brand/manufacture. So, does anyone know of such a service/library? Anybody interested?

I found some circuit board diagrams with parts layout in some of the service Manuals and the operations manuals. The transverter books have them, and the 520 manual has them. If your looking for a place to get your negatives there's a good start. there are outfits out there that will make a board for you. you stuff the board obviously. find out who ARRL uses for thier projects.

BAMA is busy. Can someone check your 830S service manual and let me know whether R-11 (470 ohms) in the Rectifier Board is 1/2 or 1W. The one that is in there now is about halfway in size between the two.

Thanks,
Joe k7mks

Hi Joe,
It is 470 ohm 1 Watt Metal Film. Did you find that it is bad
causing your loss of SG ? I know I have found many many instances
where a radio's problem was due to a faulty component on the Rectifier
Board. It is the FIRST place I go when checking out a rig.
By the way, when BAMA is busy, go to my site for manuals
www.n6wk.com/kenwood FREE downloads to all.
I just added a bunch of TS-510 Files and more

I replaced every lamp in my 820 with the 12 volt wheat lamps Radio Shack sells. The only ones that were difficult to install were the internal and external VFO dial lamps. The others were easy. They are as bright as the original lamps from Kenwood and only required a trip to Radio Shack to get em.

Hey Kevin, on the plate current, I have essentially the same 260ma after several iterations of plate dip and load peak on 40m, with about 110w out on my 830. So I think your rig is just fine. If I recall the manual says no higher than 265ma, and I routinely "unload" by a few milliamps. I don't think that there is any downside to backing down the load control to run a few milliamps lower. I believe that is actually good practice to preserve tube life.

Subject: [TS-520_820_530_830] Re: TS-830S Excessive Grid Current

Good afternoon everyone. I figured I should post an update to let everyone know how this project has been going.

Walt - I apologize for not replying to your previous post. I just overlooked it until I sat down to write this reply.

I have the rig on the air and just made a contact on 40 meters with it. It is certainly usable now. Audio and signal reports were favorable with nothing objectionable noted. I have a couple of questions that I will pose to the group in a moment.

Here is all that comes to mind about what I did to try to get this rig operational again. I thoroughly checked all of the components on the rectifier board as one person suggested. I found nearly all of the carbon comp resistors on that board were out of specification. Most were probably within range of what would be expected given their age. I found one of the 470K resistors was completely out of range. I wish I was able to tell everyone exactly which one it was. As I said before, nearly all of them were outside of the stated tolerance. After finding that, I just started removing them from the board and throwing them in a pile. I had decided to replace all of the resistors on the board. Once I had them all in a pile, I began checking them again. That is when I found one that checked way high. Again, I don't know which position it came from. I can only say that the markings indicated it was one that should have been 470K.

I found that the cathode resistors I had previously replaced were up around 30 ohms now. I replaced those again.

Several of the .047 ceramic disk caps on the final board looked as if the edges were eroding away. I'm not sure if that was from physical wear from me having the board in and out so much or from an electrical problem. They did not appear to have been overheated and were not shorted. In any event, I replaced all of them that appeared suspect.

I also began to wonder if my "new" tubes may, in an unlikely coincidence, be bad. I swapped them out with another old set that I had (not the same set that were installed when this problem first occurred).

I checked final output relay and found the contacts on one side were pitted. Each side exhibited some resistance. I cleaned the contacts and resolved that problem.

That's all that I can think of right now in the way of changing things.

I realize that the way I went about this makes it difficult to isolate exactly what the problem was, but I was getting a little frustrated with this rig and about ready to stick it on the shelf.

I fired it up and things seemed to check out reasonably well. I neutralized the tubes and gave things a final check.

This leads me to my only remaining issue with regard to the transmitter section...

When tuning the transmitter, I find that the plate current is up around 260mA after dipping it, if I have the load control set for maximum RF out (about 115 watts). If I reduce the load control so that the RF is about 100 watts, the plate current is about 240mA.

I think that is still a shade higher than what it should be. I was looking for something down near 225mA. My understanding of the tuning proceedure is that I should increase the load control to the point of maximum RF while periodically dipping the plate current during the process.

Is 260mA unacceptable? If so, is there any harm in reducing the load control to bring the plate current down some.

I should mention that I obtained all of these figures on 40 meters. I have not tried loading it on other bands yet.

Thanks to everyone who offered assistance to me on this project. I appreciate your time and effort. I may not have everything completely fixed, but at least the rig is usable now.

The issue with no TX and weak RX on the 28Mhz position still exists, and after looking at things while spending so much time with this rig, I think that is the result of a botched 11 meter mod. I may wrestle with that at a later time.

What are your thoughts on the level of plate current? In the mean time, I'll check it on other bands and see what I come up with.

Kevin

Yahoo! Groups Links

10620. Bama's mirror site

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-26 05:41:36 UTC
From: w5rkl
Topic: 10620 Message: 10620

The link below is Bama's mirror site. It's much easier to get to then the main Bama site. This is the site I use. I don't go to Bama's main site anymore unless I manually download files using the ftp command in Windows "cmd" DOS window.

http://bama.edebris.com/manuals/

This takes you right to the manufactures listing. Just click on the one you want and download the manual. Some are pdf's and some are djvu. You can download the djvu viewer by following the link on this website or google "djvu viewer" and follow the links. It works just like Adobe and is a plug-in for IE6,7 and Mozilla FireFox plus it works as a plain ole Windows djvu file viewer like Adobe.

73's,

Mike
W5RKL

10621. Re: [TS-520_820_530_830] Bama's mirror site

Mike,
In Windows XP, CMD it is NOT a DOS window.
It is simply Emulating a DOS window.
hi hi..
73,
Gordon
N6WK

Kenwood recommends a maximum resonant plate current for the TS-830 of 260ma or less. This is outlined on page 18 of the operators manual.

10623. Re: [TS-520_820_530_830] Re: TS-830S Excessive Grid Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-26 10:52:00 UTC
From: n9wb
Topic: 9760 Message: 10623

If you are turning the load control counterclockwise to back it down, you are degrading the final linearity.

Subject: RE: [TS-520_820_530_830] Re: TS-830S Excessive Grid Current

Hey Kevin, on the plate current, I have essentially the same 260ma after several iterations of plate dip and load peak on 40m, with about 110w out on my 830. So I think your rig is just fine. If I recall the manual says no higher than 265ma, and I routinely "unload" by a few milliamps. I don't think that there is any downside to backing down the load control to run a few milliamps lower. I believe that is actually good practice to preserve tube life.

Subject: [TS-520_820_530_830] Re: TS-830S Excessive Grid Current

Good afternoon everyone. I figured I should post an update to let everyone know how this project has been going.

Walt - I apologize for not replying to your previous post. I just overlooked it until I sat down to write this reply.

I have the rig on the air and just made a contact on 40 meters with it. It is certainly usable now. Audio and signal reports were favorable with nothing objectionable noted. I have a couple of questions that I will pose to the group in a moment.

Here is all that comes to mind about what I did to try to get this rig operational again. I thoroughly checked all of the components on the rectifier board as one person suggested. I found nearly all of the carbon comp resistors on that board were out of specification. Most were probably within range of what would be expected given their age. I found one of the 470K resistors was completely out of range. I

wish I was able to tell everyone exactly which one it was. As I said before, nearly all of them were outside of the stated tolerance. After finding that, I just started removing them from the board and throwing them in a pile. I had decided to replace all of the resistors on the board. Once I had them all in a pile, I began checking them again. That is when I found one that checked way high. Again, I don't know which position it came from. I can only say that the markings indicated it was one that should have been 470K.

I found that the cathode resistors I had previously replaced were up around 30 ohms now. I replaced those again.

Several of the .047 ceramic disk caps on the final board looked as if the edges were eroding away. I'm not sure if that was from physical wear from me having the board in and out so much or from an electrical problem. They did not appear to have been overheated and were not shorted. In any event, I replaced all of them that appeared suspect.

I also began to wonder if my "new" tubes may, in an unlikely coincidence, be bad. I swapped them out with another old set that I had (not the same set that were installed when this problem first occurred).

I checked final output relay and found the contacts on one side were pitted. Each side exhibited some resistance. I cleaned the contacts and resolved that problem.

That's all that I can think of right now in the way of changing things.

I realize that the way I went about this makes it difficult to isolate exactly what the problem was, but I was getting a little frustrated with this rig and about ready to stick it on the shelf.

I fired it up and things seemed to check out reasonably well. I neutralized the tubes and gave things a final check.

This leads me to my only remaining issue with regard to the transmitter section...

When tuning the transmitter, I find that the plate current is up around 260mA after dipping it, if I have the load control set for maximum RF out (about 115 watts). If I reduce the load control so that the RF is about 100 watts, the plate current is about 240mA.

I think that is still a shade higher than what it should be. I was looking for something down near 225mA. My understanding of the tuning proceedure is that I should increase the load control to the point of maximum RF while periodically dipping the plate current during the process.

Is 260mA unacceptable? If so, is there any harm in reducing the load control to bring the plate current down some.

I should mention that I obtained all of these figures on 40 meters.
I have not tried loading it on other bands yet.

Thanks to everyone who offered assistance to me on this project. I
appreciate your time and effort. I may not have everything
completely fixed, but at least the rig is usable now.

The issue with no TX and weak RX on the 28Mhz position still exists,
and after looking at things while spending so much time with this rig,
I think that is the result of a botched 11 meter mod. I may wrestle
with that at a later time.

What are your thoughts on the level of plate current? In the mean
time, I'll check it on other bands and see what I come up with.

Kevin

> Just to humor me, please turn the rig off. Let it discharge. With
your ohm meter measure the resistance from pin 1 on either final tube
socket to ground. Pin 1 is where the 20 ohm resistors go. Do not
remove the tubes or resistors when doing this. Please let me know what
the resistance it.

If you can find a circuit board overlay, try FAR circuits http://www.farcircuits.net/ They make a fair amount of custom circuit boards.

Many QRPers use them to make up circuit baords for projects. So does the ARRL. I think they may even build up a board from scratch for you, if you only provide a schematic. Naturally I think they charge extra for doing that.

Gordon
Re these schematics. in the centre of the schematic is L4. Is this a part of the transformer or is It a separate coil that I can't find.
thanks
Barry

I would not recommend reproducing a single Kenwood PC board without the express written permission from Kenwood. Even having received written permission, I would have the written permission document reviewed by a Patent and/or copywrite attorney first before reproducing any Kenwood PC board. I have written to another ham manufacture that no longer is in the ham equipment business to do this very thing. As of yet, If I'm successful, I'll use ExpressPCB to make the PC boards. I've used them in the past and their quality is excellent.

73's,

10629. Re: TS-830S Excessive Grid Current

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-26 16:58:57 UTC
From: w5rkl
Topic: 9760 Message: 10629

I believe this thread is about PA current not PA GRID current. There is a huge difference. Any 6146B final tube(s) with a GRID current of 260ma will be instantly destroyed.

The grid and plate specifications for the 6146B tube depends on the class of service. Typical single 6146B tube operating plate voltage, again depending on the class of service, is between 600 and 750 vdc. A single 6146B tube typical operating plate current, also depending on class of service, is 25/125ma in Class AB1, 140ma in Class CP and 160ma in class CT. Single 6146B tube typical operating grid current is, 2.7ma in Class CT and 3.4ma in Class CP. The tube specifications provided here were obtained from page 24.29 of the ARRL Handbook 2001 issue.

You can computer the DC input power by performing the following. This procedure should be carried out QUICKLY to prevent damage to the final tubes:

1. Connect the 830 to a dummy load.
2. Tune up the 830 as outlined in the operators manual for CW mode.
3. Place the 830 in CW, meter switch in IP and key the 830.
4. Note the meter reading and quickly switch the meter to HV position and note the reading. You should this step by unkeying each time.
5. Unkey the 830.

Again, it's important that you perform the above steps QUICKLY to prevent damage to the final tubes in the 830.

Using ohms law, multiply the HV reading by the IP reading and your answer will be the 830's DC input power in watts.

An example, if the final plate voltage reading (HV position) is 800 and the IP reading (IP position) is 260, using ohms law, P = I x E, the DC input power is 800 x .260 = 208 watts input.

Why the rush? If you're driving a dummy load and have the finals tuned, then you should be able to go key-down for more than the time needed to take the IP and HV readings without rushing, right? Am I missing something here?

- Keith -

-----Original Message-----

You can computer the DC input power by performing the following. This procedure should be carried out QUICKLY to prevent damage to the final tubes:

1. Connect the 830 to a dummy load.
2. Tune up the 830 as outlined in the operators manual for CW mode.
3. Place the 830 in CW, meter switch in IP and key the 830.
4. Note the meter reading and quickly switch the meter to HV position and note the reading. You should this step by unkeying each time.
5. Unkey the 830.

Again, it's important that you perform the above steps QUICKLY to prevent damage to the final tubes in the 830.

Using ohms law, multiply the HV reading by the IP reading and your answer will be the 830's DC input power in watts.

An example, if the final plate voltage reading (HV position) is 800 and the IP reading (IP position) is 260, using ohms law, P = I x E, the DC input power is 800 x .260 = 208 watts input.

Follow the Operators Manual.

All Class AB radios that utilize a Pi network output circuit have critical tuning. Tune and Load controls are tuned for maximum power output with spec drive level. If you are to err at all, err on the side of greater load because detuning and/or unloading results in a flood of harmonic and intermodulation distortion. If you wish to reduce the dissipation for QRP, Teletype, Data, reduce the drive after a proper full power tune-up.

Pa Idling current need not be greater than 50 ma. (Some say 25ma.) and never more than 60ma. If this is varying by a great amount as the radio warms up, perhaps you have soft tubes.

If plate current dips and maximum power output IP are more than a few MA different, you may need to neutralize.

I have run Teletype for years on the original 6146b's. Only a couple seconds of keydown at a time during tune-up will keep from stressing your tubes and keep you from nailing the power supply fuse.

I replaced the Driver tube once after a newbie got to it at field day.

Follow the Operators Manual.

Hi Keith.

The general recommendation for any tube type final (or amplifier) is to never key-on and tune for more than 5 seconds at a time, and then wait at least another 5 seconds or more before keying the radio and tuning again. The reason is heat damage to the final tubes which will affect their life. The less key-down time you use in tune-up, the longer the tubes will last.

Another point just made by "nospamvictim" is that the idling current does not need to be at 60ma on these Kenwood hybrids. One of the guys who repairs Kenwoods told me a year or so ago that 50ma was plenty, and that the tubes would last longer that way. All my TS Kenwoods are set for 50ma and seem to work fine. I think this just moves the "operating point" on the tubes a small amount, but I have never looked at the tube curves to see what the theoretical impact might be. Perhaps someone in the group can elaborate on that point.

73, Bill, K5GCW

Why the rush? If you're driving a dummy load and have the finals tuned, then you should be able to go key-down for more than the time needed to take the IP and HV readings without rushing, right? Am I missing something here?

- Keith -

-----Original Message-----

You can computer the DC input power by performing the following. This procedure should be carried out QUICKLY to prevent damage to the final tubes:

1. Connect the 830 to a dummy load.
2. Tune up the 830 as outlined in the operators manual for CW mode.
3. Place the 830 in CW, meter switch in IP and key the 830.
4. Note the meter reading and quickly switch the meter to HV position and note the reading. You should this step by unkeying each time.
5. Unkey the 830.

Again, it's important that you perform the above steps QUICKLY to prevent damage to the final tubes in the 830.

Using ohms law, multiply the HV reading by the IP reading and your answer will be the 830's DC input power in watts.

An example, if the final plate voltage reading (HV position) is 800 and the IP reading (IP position) is 260, using ohms law, P = I x E, the DC input power is 800 x .260 = 208 watts input.

Not always true for tube finals. Depends on the class of operation and circuit design. Sweep tube design rigs and amplifiers definitely fall into that category because of the upper limit that they operate. My tube final pair of 6146's in my Heathkit Apache can keyed down for long, long periods of time running in the AM mode. My Kenwood 599D Twins, operating in the AM mode with a pair of 6146B's, can also key down for long periods of time. However, any rig that's just designed primarily for SSB/CW service, should adhere to a short key down time which is the case for the rigs in our group.

Sorry about that. It is dead centre on the PS-510 schematic. It is labelled L3 4H 300ma. There is a straight line drawn parallel to the coils. Does this line indicate that it is part of the main transformer.
thanks
Barry

Hi Pete.

Thanks for the clarification. I was not thinking AM operation when I made my comments. Goodness knows, my old Heathkit DX-100 used to be keyed-on for some long "rag-chewing" back in the 1950's. I always appreciate your comments to the group Pete. Have a good day.

10645. (Newbie Advice Needed) Tools I should get for fixing up non-working 520-s?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-27 13:27:45 UTC
From: Jody Mills
Topic: 10645 Message: 10645

I have a non-working 520-s that I was originally going to send to Ken Kemski to have refurbished, but I'm having second thoughts. It's not anything to do with Mr. Kemski, as it's a no-brainer that he could do a much better job (and quicker) fixing and refurbishing my radio than I can. However, I actually want to LEARN about how to work on this old radio. Right now I have ZERO tech skills, but I'm willing to learn. And what better way to learn than on an old radio that already doesn't work. The worst thing I can do is--fix it.

A little background: I got the radio off of an Ebay auction where the seller was up front about the radio not working. The seller said that they turned it on, heard a popping sound, saw a wisp of smoke come from the radio, and then it went dead, never to turn on again.

I would be interested to know if this sounds familiar to anyone here and what it likely means. I would also like to know what tools I will need for working on this radio and where I can likely get them. I do have a local Radio Shack where I live if that helps.

By the way, the FCC issued my callsign yesterday, 10/26/06. I am officially a Technician class license holder, and my callsign is KE7JII. I will upgrade in a few months, but right now I'm just getting my feet wet with the local vhf community and looking forward to tearing apart my old Kenwood.

Thanks in advance for your help!

Jody A(lan) Mills, KE7JII

Hello Jody,
Well to start off with,get a good solder iron that will do a good clean job and a volt meter Try to locate the service manual and schematics. If you don't have a schematic you can download one. The guys will tell you how to get it. I don't know were to download it at this time because I had the service manual for my rig. Take the case off the radio and just take a good look at each board to see if
you see anything that does not look right. (Like black parts with a trace of smoke)
If the radio went dead with a pop or two it may be a power supply.
You can look at ken's web site K4EAA . The schematics may be on his site.
Chris..

From: Darwin, Keith
Topic: 10645 Message: 10647

I assume this is your first license?

Congratulations! I'm waiting for a new call from the FCC but in my case it is a vanity call change. When it's done I'll still be a somewhat crusty, sort-of middle-aged fart with the same privileges I had before.

KE7JII - not a bad CW call. If you haven't started learning the code you may want to consider. The best reason to learn CW is because it is fun!

73!

Good Morning Jody.

Yes, there are a number of very qualified people on this reflector that willingly help each other solve problems with their radios - they have certainly helped me find some difficult problems.

The main things they need to know in order to effectively assist someone are how knowledgeable is the person, and what types of test equipment do they have.

You say you have "zero" technical skills. If this is actually true, one of the best things for you to do is get with a local group of hams who can coach you and show you some hands-on type of procedures such as soldering, reading schematics, and the use of different types of test equipment. Safety is a major concern when working on these types of hybrid radios that have lethal voltages inside, because they can really hurt you unless you are taught how to work with them safely. Some things you will be able to learn much more effectively when taught in person, rather than by email. You will also need to tell us where you are located since you are not listed on QRZ.com yet.

Please understand I am not trying to discourage you from repairing your TS-520S. All of us started out, at some point in our lives, exactly where you are today, and our interest in electronics gave us the desire to learn as much as we could about our areas of interest. I am sure there are members of this group who will try to assist you regardless of your level of technical abilities.

From your description of the radio's failure, the problem could be as simple as one of the final tubes shorting out internally and blowing some resistors up. But there are a number of things that could cause the symptoms you describe. Since you say nothing comes on now, the protective fuse on the input AC probably blew. However, you need to try and determine why the fuse blew before you replace it, turn the radio on again, and maybe cause more damage. There are some people on here who are very knowledgeable of the TS-520S who should be able to talk you through several things to check. I do not have any documentation on that radio myself.

I would encourage you to continue in the direction you have started Jody. If you come up with any questions I can handle, I'll jump in and try to help.

73, Bill, K5GCW

Ummmmmm, I think both of you are partially right. I have my TS-820 (which of course uses 6146Bs), and a Swan 270B (which uses a 6LQ6 sweep tube for a final). Both rigs do require you to limit the amount of keydown time, until the finals are tuned my Kenwwod shouldn't be keyed up in the CW mode, for more than 10 seconds. My Swan manual states that the final shouldn't be loaded up for more than a few seconds, due to it's circuitry, which causes the plate dissipation to exceed the 6LQ6's plate dissipation capability when the final is out of resonance. This is also the case with the Kenwood, but unlike the 6LQ6, my 6146Bs won't necessarily get nuked, if I load them up up out of resonance for too long. I've been told that mods can be made to the the circuits Swan used (and in later radios, Swan made some of these mods themselves), to limit, the susceptability to finals destruction, if you key down too long, when you're out of tune.

When the finals on my Kenwood are tuned/resonated, I don't have to hold to the keydown limits mentioned above. Although, I don't think you want to key down for 5 or 10 mintutes straight, as the heat will start to stress out the tubes (in spite of the fan on the back of the rig). Swan recommended that my 270B, be lmited to no more than about 30 seconds keydown time, after the final is resonated. This is partially due to the 6lQ6 sweep tube's dissipation. It's also due to heat removal issues in my opinion (the 6LQ6 is mounted on its side, along the bottom of the 270B, where air current flow isn't the greatest [adding a fan will help this issue]).

All comments are welcome. I'm on vacation today, yeah!

73,
Ellen - AF9J

Hello Jody,
Well to start off with,get a good solder iron that will do a good clean job and a volt meter Try to locate the service manual and schematics. If you don't have a schematic you can download one. The guys will tell you how to get it. I don't know were to download it at this time because I had the service manual for my rig. Take the case off the radio and just take a good look at each board to see if
you see anything that does not look right. (Like black parts with a trace of smoke)
If the radio went dead with a pop or two it may be a power supply.
You can look at ken's web site K4EAA . The schematics may be on his site.
Chris..
Jody Mills <jody.mills@...> wrote: I have a non-working 520-s that I was originally going to send to
Ken Kemski to have refurbished, but I'm having second thoughts.
It's not anything to do with Mr. Kemski, as it's a no-brainer that
he could do a much better job (and quicker) fixing and refurbishing
my radio than I can. However, I actually want to LEARN about how to
work on this old radio. Right now I have ZERO tech skills, but I'm
willing to learn. And what better way to learn than on an old radio
that already doesn't work. The worst thing I can do is--fix it.

A little background: I got the radio off of an Ebay auction where
the seller was up front about the radio not working. The seller
said that they turned it on, heard a popping sound, saw a wisp of
smoke come from the radio, and then it went dead, never to turn on
again.

I would be interested to know if this sounds familiar to anyone here
and what it likely means. I would also like to know what tools I
will need for working on this radio and where I can likely get
them. I do have a local Radio Shack where I live if that helps.

By the way, the FCC issued my callsign yesterday, 10/26/06. I am
officially a Technician class license holder, and my callsign is
KE7JII. I will upgrade in a few months, but right now I'm just
getting my feet wet with the local vhf community and looking forward
to tearing apart my old Kenwood.

Thanks in advance for your help!

Jody A(lan) Mills, KE7JII

Barry,
Happy Birthday.
I believe that you will find that L4 is a 4 Henry Choke rated at 300 ma.
It probably looks like a small transformer but will only have 2 leads.
I have NO idea where it would be located on your 510 though.

73,
Gordon

When the finals on my Kenwood are tuned/resonated, I don't have to hold to the keydown limits mentioned above. Although, I don't think you want to key down for 5 or 10 mintutes straight, as the heat will start to stress out the tubes (in spite of the fan on the back of the rig).

That's more of the sort of thing I'd expect. Key down times should be very short if the finals aren't tuned, but can be longer if they are tuned. If the rig can't take 10 seconds of key-down when tuned, how can you do a 4 minute rag chew transmission?

Hi Keith,

What call did you put in for? My call is a vanity call too. I held my original WD9 2x3 call until late 1998 (4 1/2 years after I got my Extra), but I got sick of being asked for repeats on my call for the last 2 letters, during contests. Being a QRP contester, I had read that going to a shorter call can help things. I tried getting a 2x1 WD9 call (I like that prefix of course), but perusing qrz.com, showed that they were all taken. So I figured I'd get one with a weird prefix (which would also make it more desirable in the WPX). I also wanted one with decent CW, and phone phonetics (remember Keith, I work CW, phone, and the digital modes). Perusing qrz. com again showed that AF9J, was not only unused, but indicated that it had never been used. That did it for me. I paid the $50 fee (geez!, what a ripoff!, nowadays it's less than half of that), and got my present call.

Believe it or not 3 years later, I found out that back in 1976 (when the FCC was issuing bicentennial 2x1 A-prefix calls), some oldtimer had held my call. In 2001, I received a QSL card, from an SWLer, who had heard me during a contest. He not only informed me that my call had been held by somebody else before me, he sent me a photocopy of the QSL card he'd received from this guy, back in 1977! Go figure! BTW Keith, at renewal time, you have to pay the feds $22 to keep your vanity call, otherwise, they give you another call out of the sequential list.

Topic: 10645 Message: 10661

Hi Ellen (& all),

My current call, KD1E is a vanity call that I got several years ago. I wanted K1KD or maybe KE1TH, but both were taken. KD1E at least started with my initials and is short on CW. I've found it confuses people though. Ending in E is so light on CW that I often get "KD1E?" coming back at me. I wanted something a bit heavier, preferably a 1x2.

So, I decided to apply for W1AP which was about to become available. I paid the money to W5YI but they called and said too many other people are applying for W1AP; I'd never get it. Instead they had a list of calls that are still active, but whose owner has been SK for over 2 years. Said they'd send the SK proof to the FCC to get the call cancelled and at the same time apply for it in my name. Voila, a call suddenly becomes available and I'm the only one with an app.

The new call is ... N1AS. A 1x2, nice and short for CW, ends with enough weight to be heard through QRM / QRN, has a nice ring on phone. Yep, I'll be pretty happy. I like it better than W1AP.

Assuming W5YI knew what they were doing with the application and I get the call, I'll be one happy camper!

If not, I'll remain KD1E which isn't half bad!

- Keith KD1Efornowbutwithanylucki'llsoonbeN1AS -

P.s. Nice story about the history of your call. With calls being recycled, their history starts to become something of interest.

From: w5rkl
Topic: 10645 Message: 10662

Afternoon Jody,

There are some initial checks you can do without applying power to or plugging the 520 into the wall outlet.

A few initial tools that you can accumulate are small wire cutters, needles nose pliers and those forecipts doctors use. The plastic ones are good for picking out nuts, washers and small screws that always fall into the tightest places regardless of how careful you are. Don't ya just hate that? The metal ones, available at ALL ELECTRONICS, are good for heat sinking components during soldering plus they hold components nicely.

Some other test equipment items are listed below. These items will more than likely not be needed right off, the list is just a basic list of test equipment, over time, you might need.

1. Good stable signal generator. I recommend the AN/URM-25D available at Fair Radio Sales. Vary wide range of frequencies covered plus it is very stable. If you buy one from Fair Radio, ask for a "checked" one. It takes a bit longer to get but it's worth the wait.

2. A couple of decent VTVMs. Heathkit has a couple of nice one which can be obtained for a few dollars. The IM-18, I believe, is a nice VTVM. It comes in 2 version, the upright and low rider version that has a handle that doubles as a tiling handle, both are very good and are inexpensive. Make sure you get the probes. If not, they can be made.

3. Something you may not need right away but later on, as you experience grows, a good dual trace oscilliscope. They are actually very easy to use and a good one for ham repairs can be obtained for $100 or less. I have an E&L INSTRUMENTS 20Mhz. Mostly you'll use this with frequency generating and IF circuits. The 520, 820, 530, 830 etc, have IF's in the 8 Mhz range so a 20Mhz dual trace scope is a good one to have.

4. Two nice analogue VTVMs. Why analogue? Digital volt meters are great but with very small variations, there's nothing like an anlogue VTVM. I say 2 becaues you never know when you will need another one, especially when doing IF alignments and monitoring the output of the audio amplifier. With only one, your stuck to switching from one circuit to another. VTVMs are inexpensive and can perform a number of troubleshooting tasks. Also, VTVMs have a very high input impedence and don't load down a circuit like a simply VOM does.

5. A digital volt meter. I have a very nice one that only cost $19 and it reads frequencies up to 20Khz and capacitances values. You don't need to spend a fortune on a DVM. Most of the time you'll be taking voltage readings. The DVM will work along side your analogue VTVMs.

6. A good soldering pencil with interchangable tips. Radio Shack sells a nice 20/40 watts pencil with interchangable tips for a very cheap price. The 20 watt range is for small, solid state projects. The 40 watt range for larger projects such as soldering so-239 etc. I discourage the use of a 40 watt pencil on small solid state circuit and PCBs. The additional heat can, if not careful, damage the component along with possibly lifting the PCB trace. I use a 20 watt pencil in all solid state work. When soldering, always use a heat sink clip. The clip absorbs heat, preventing or greatly reducing the heat that travels on the lead to the component. Prevents or helps to prevent damage to heat sensitive components such as transistors, some diodes etc.

7. A simply function generator. A function generator will come in handy when working on audio circuit. I bought a kit for $9, one single IC chip in a socket plus a few parts and it works from 1hz to 7Khz, well within the range basic repairs require and it runs on a 9 battery.

Parts:

Do you need alot of them? Heavens no. First, it's a waste of money and second, you more than likely will never use all of them. I keep a supply of resistors both 1/4 and 1/2 watt ranges. I do this because I do alot of repair work. As you gain experience and learn more, you too may think you need more parts.

I have given you some basic ideas. While you're building you tool base, download the manuals and review them. Another item I forgot to mention. A good technical reference manual is a good item to have. First thought is the ARRL handbook. Although the newer versions are great reference books, I rely alot more on the older version, 1951 and 1966, for example. Why? They have alot more basic information and are much easier to use. With them, you don't have to sift through engineering stuff to find the basics. The older handbooks were geared, in my opinion, towards troubleshooting and learning circuit operation. The newer version do have more solid state references so you're choice. The older handbooks are inexpensive and will provide you with a wealth of knowledge and basic circuit operation.

In closing, although electronics may appear, the operative word here is "appear" complex, don't let that confuse or stop you from learning. Ham radio is the only hobby that you can learn by doing and you learn everyday, whether you realise it or not. Also, ask questions. There are no stupid questions here. We all learn from each other and we all have something to give to one another. But, most of all, have fun Jody. That's what this group and ham radio is all about, having fun and learning.

73's,

Mike
W5RKL

Gordon
You nailed it first try. It is picture seven in the VA7GEM folder.
http://ph.groups.yahoo.com/group/TS-520_820_530_830/photos/view/4cc6?b=7&m=s&o=2
I just didn't recognize it as a choke as it is the size of a power transformer.
thanks
Barry

From: Peter A Markavage
Topic: 9760 Message: 10664

I would suspect, using 6146's as an example, that as long as you don't exceed the plate dissipation rating of the tubes in a particular class of service, you can key down all day long. Many many AM/FM broadcast tube transmitters run key down (plate switch on; or whatever you want to call continuous operation) 24/7. However, the TS-5xx/8xx aren't designed for this type of service. Take the same 6146's, put them in a DX-100, Apache, or some other AM tube rig that uses them, and "key down" for many minutes is the norm. It's all in the design and how far to the edge do you position the tube parameters.

Ellen

I could read emails but when I sent the ones for the group were bouncing back. I asked james what bouncing was and he explained it to me briefly. We were talking transverter direct and I could reach him.

I reset the account last nite. It went on for 2 or 3 days for me. I sent to you and Gordon and Walt and it kept comming back. It's working now.

James helped me thru the transverter cable problem thus far. I may have a viable cable wiring combination. I first must make sure why the transmitter wire passes back into the 520 before going to the TV-502. The 506 doesn't seem to do that. If I get that part cleared, I can begin the next step. building the cable.

I bought a DB-25 assembly kit to use the pins for the substitution connector. I am wondering if it would be better to use the DB-9 pins like on the back of a computer monitor being as they are a little smaller. This way I wouldn't widen the mates in the socket as easily.

I must find a way to secure the pins as a connector. James suggested something like RTV sealant to hold the pins fast. Iwas thinking maybe use a piece of circuit board betwenn the rows to hold the pins to. another idea I came up with is to move the whole assembly into a mold and pour some kind of liquid plastic in to make it a firm one piece connector. Then heat shrink a sleeve around the cable to the transverter connector.

Any suggestions?

Walt,

On the TS-520 the transverter cable passes a section of the cable back into the TS-520. Do you know the reason for this? I'm trying to determine if I can bypass to the transverter without a problem. It seems to be the transmit out to the transverter. 830 doesn't have this. I'm not sure if any of the other models do this. I have yet to look further into the schematics of 520 to find out and if it changed at 520S or 820 or even at 530. If it works ok with the bypass I can go ahead with the cable assembly. I'm going to build a conector for the transverter side since one is not readily available. I got a DB-25 kit to build a connector using the pins. Got any ideas?

Topic: 10645 Message: 10670

Congratulations on the tech liscence. Remember, when you get the 520 going you can work VHF 6 and 2 with transverters too.

As for the radio repair you may want to do what you can yourself first. You do have a group of knowledgeable people here to call upon for advice to deal with issues.

First I'd look around inside for obvious signs of where things went wrong. As you know you let the smoke out of some things they don't work any more. Such is probably the case here. Even if you don't know the parts thats ok. You see the signs sometimes where it happened.

Try not to touch the parts inside yourself as they may still have a charge on them. If you must touch something, try to ground it out to the chassis first. By touching the lead to the chassis, you may drain that part of the circuit of any power that could harm you.

If you should go ahead with your learning your radio as you have said, you will become intimately familiar with your radio. you will learn how to replacw tubes when the time comes and how to clean yourr radio. You will discover it's good sides and it's drawbacks. You have a good radio there in a TS-520. It's a good radio to start with.

Our other models the 520S and 820 and 530 and 830 are similar as you will discover in your reading. The group has a good and growing archive a good place to spend time and read. Any questions you can adress to the group. Word them well as they wil help you to get back a better answer. For them to understand what you are asking about you must be able to paint a clear picture in their minds.

A word to the wise. Many a person who works incircuits will usually work one handed on the radio. Some believe in putting thier other hand in a pocket. they may talk to themselves too, but that's alright. Some of the best tech's Ive seen do that.

What you can't do, there's always Ken. There's others too. You may meet them here.

Last, do you have the manual that came with the radio? Gordon has a web page with it as well as the archives. There's other places you can get copies from. BAMA is a place to look at. I just bought CD's of my radio. The transverters too.

You will be working in one of the last radios built a person can with a few tools work on themselves.

I'd suggest you replace the fuse if need be and keep the one blown for a while. Do not plug your radio in again until you know it's safe to.

Your problem could be a number of things. But don't power up again as you may waste the transformer out. They are few and far between for replacement and are not cheap usually. I got lucky and one was found within the group for about 30 dollars for one of my 830's. I found one website where the transformer was available for about a hundred dollars more. That's an example for the investment value. Some parts you can't buy new now.

So there's a little insight for you to look ahead with. Welcome to the group and congrats again on tech.

As new tools go a soldering tool is one and a meter. If you buy a multi meter buy a cheap one first and go fancy later. the cheapones a little more forgiving and when not it's cheaper to replace. Eventually somewhere down the road you may opt to get an oscilloscope, but that's well down the road. Some people don't have this and have not the need for one. Like I said that's probably later. You may find someone who has one to help you with tihs should the need arise.

An antenna dummy load will be an important tool too. You'l use this to load the power of your radio without damaging it. That's after you get it up and running.

Now back to you. John-KA3DPW- General
Jody Mills <jody.mills@...> wrote:
I have a non-working 520-s that I was originally going to send to
Ken Kemski to have refurbished, but I'm having second thoughts.
It's not anything to do with Mr. Kemski, as it's a no-brainer that
he could do a much better job (and quicker) fixing and refurbishing
my radio than I can. However, I actually want to LEARN about how to
work on this old radio. Right now I have ZERO tech skills, but I'm
willing to learn. And what better way to learn than on an old radio
that already doesn't work. The worst thing I can do is--fix it.

A little background: I got the radio off of an Ebay auction where
the seller was up front about the radio not working. The seller
said that they turned it on, heard a popping sound, saw a wisp of
smoke come from the radio, and then it went dead, never to turn on
again.

I would be interested to know if this sounds familiar to anyone here
and what it likely means. I would also like to know what tools I
will need for working on this radio and where I can likely get
them. I do have a local Radio Shack where I live if that helps.

By the way, the FCC issued my callsign yesterday, 10/26/06. I am
officially a Technician class license holder, and my callsign is
KE7JII. I will upgrade in a few months, but right now I'm just
getting my feet wet with the local vhf community and looking forward
to tearing apart my old Kenwood.

Thanks in advance for your help!

Jody A(lan) Mills, KE7JII

Ellen R <ellenjoanne2003@...> wrote: Hi Keith,

What call did you put in for? My call is a vanity call too. I held my original WD9 2x3 call until late 1998 (4 1/2 years after I got my Extra), but I got sick of being asked for repeats on my call for the last 2 letters, during contests. Being a QRP contester, I had read that going to a shorter call can help things. I tried getting a 2x1 WD9 call (I like that prefix of course), but perusing qrz.com, showed that they were all taken. So I figured I'd get one with a weird prefix (which would also make it more desirable in the WPX). I also wanted one with decent CW, and phone phonetics (remember Keith, I work CW, phone, and the digital modes). Perusing qrz. com again showed that AF9J, was not only unused, but indicated that it had never been used. That did it for me. I paid the $50 fee (geez!, what a ripoff!, nowadays it's less than half of that), and got my present call.

Believe it or not 3 years later, I found out that back in 1976 (when the FCC was issuing bicentennial 2x1 A-prefix calls), some oldtimer had held my call. In 2001, I received a QSL card, from an SWLer, who had heard me during a contest. He not only informed me that my call had been held by somebody else before me, he sent me a photocopy of the QSL card he'd received from this guy, back in 1977! Go figure! BTW Keith, at renewal time, you have to pay the feds $22 to keep your vanity call, otherwise, they give you another call out of the sequential list.

Yeah circuitry has a lot to do with it Pete. I agree.

Hi John,

I like the 2nd idea of using poured plastic. It will be mechanically sturdier. But you will need to make sure that the pins stay aligned during molding. Another thought might be to mount the pins in a cicuit board for spacing purposes, and rather than using plastic, use epoxy. It'll be cheaper than plastic you can work with at home, you won't have to deal with the heat issues plastic will give you during molding, and will be far stronger, when dry. Oftentimes in industry, poured epoxy is used instead of plastic. You can get it at Ace Hardware. I used it years ago to pot guitar pickups that were microphonic (squealy) at high volume levels. Microphonic guitar pickups occur when the coils are wound too loose, and nothing is used to hold the coil windings in place. They vibrate from the volume, and cause squealing. Using epoxy on other band members' pickups (I NEVER buy a guitar or a replacement pickup, unless it will pass my squeal test) pretty much solved this problem. A word of caution, epoxy can be messy. Also, be careful about the fumes!

10677. PS-510 Power supply

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-28 16:51:07 UTC
From: digs4ruff
Topic: 10643 Message: 10677

I have almost got the power supply back together and it is looking
fairly good.
Voltages as follows:
Specifications vs Actual
-90V plus or minus 10V vs -91V
+150V vs +192V to +199V
12.5VAC vs 13.6VAC
+210V vs +232V
+300V vs +300V
+800V vs +947V

At the present moment I am not too worried about the +800V line
(unless I should touch it) but am focused on the +150V stabilized
circuitry as I am not able to lower the voltage below +192V.

regards
Barry

10678. transverters for the ts-830s?

All sounds too messy for me. I'd pop the original connectors out, replace
them with DB15's or DB23's, maybe mounted on an aluminum plate for
mounting to the rigs, and then wire them up.

Last time I powered up the supply I brought it up on a Variac as it
was the first time for the new caps. I have tested it a few times
with the light buld and now have it plugged directly to the outlet.
It will now go power on without blowing the fuse.
I checked all the caps and resistors near the stabilized +150V and
could find nothing that was far out of spec. While standing there
staring at the UC1004J board and wondering what was causing the
+150V to be +192V I noticed that neon NE2 was varying slightly in
intensity. I quickly replaced it with a new 120V neon and the 150V
circuit is now 150V and stable.
Just the +800V to follow up on but I don't see anything in the
schematic that should cause this and I don't know if this is cause
for concern. Any advice appreciated. The schematic is in the Manuals
folder if anyone wants to look at it.
thanks
Barry

I use the SSB Electronic LT6S with my 830S. Mates and works well. The Downeast stuff also mates and works well. But, then again, cosmetic matching is not an issue with me; only performance.

Low level modulator for AM; about 25 watts out on AM; has 6KHz AM filter.
If your enterprising enough, you can build the AM board (several
transistors, relay, couple of other parts) from the into in the service
manual. Just need to find a 6 KHz filter (same one is used in the 930).

10684. OT - Technician PowerPoint Study Guides

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-28 21:31:09 UTC
From: Norman Young
Topic: 10684 Message: 10684

Gang,

This is not related to either of my trusty Kenwoods, but somebody here may find it of some interest.

Our club has just produced a series of ten free PowerPoint study guides for the Technician exam. These are suitable for individual study or by an instructor in a classroom setting. Each one consists of a series of instructional slides followed by a series of questions from the pool. We chose this format so that (hopefully) a person would have a relativell painless way of actually learning the material tested, rather than just memorizing correct answers. Only time will tell whether we got it right.

This is a club project undertaken for the good of amateur radio only, and the study guides are absolutely free. You can download any or all of them from:

http://cnormany.googlepages.com/home

Please feel free to share these with anyone who might be interested in getting a Tech license, or who could use them to teach a ham class.

73,
Norman

Barry, The 800 Volt supply is probably going to be around 950 Volts with
NO load on it.
On my TS-830, the 800 Volt supply is about 950 Volts with NO load.

Gordon
It is 950V with the radio plugged into the supply in recieve mode.
The 950V is exactly and equally devided by the voltage doubler
circuit. All voltages are stable over five hours now so almost time
to put the cover on the power supply and move on to the radio.
thanks
Barry

10689. Re: [TS-520_820_530_830] transverters for the ts-830s?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-29 04:53:01 UTC
From: John Harp
Topic: 10678 Message: 10689

OK Pete, the project I undertook was to take some of these old units out here and see if they can be brought back to use for a reasonable price. They make a good start to VHF that way.

We as a group would have the info for our archives any time a question came up. james runs a 530 and I an 830. They were originally made for 520.

I was trying to learn more about our radios we love. I'm not opposed to the other options we as amateurs have available to us.

Another idea I was looking at was to possibly shift up frequency from 144 to 220 with TV-502. Much of my discussions thus far have been away from the group.

I do agree that the other ideas you describe may well be a practical way to go for many.I admit down east microwave has impressed me as well.james has suggested the conversion of a 1209 also.

But I can only look at so much at a time. Your response is well taken.

VHF is something new to me beyond FM. I chose a challenge when an opportunity arose.

I'm thinking about a 6 meter transverter as well. I'm looking also at the possibility of converting a 2 meter to 220 and having all three bands. But I haven't looked into it much. The solid state probably could do it, the circuits may need a little minor changes, the biggest question is the helical filters. The HET could be moved to 5th harmonic, the mixers retuned hopefully as well. But it's just a pondering at this point.

For now I got a unit for 80 dollars no cables and no manual. The person who sold it to me knew nothing about this stuff. The previous owner has been silent key for a couple years now.

My challengem a good one for my skills, get it to work. A second one is out there for another 80 dollars right now. I nees a cover and has been altered. 80 dollars is not going to hurt my budget if it doesn't work. If it does, then buy the other for a spare parts or get it running. If anyone is interested in joining in the group the invitation is there. James already has his running. I'm offerering the contribution of the experience should it work. James has helped me some too. We talk out along the sides between ourselves. If you would like or there is interest we'll share.

10691. Re: [TS-520_820_530_830] transverters for the ts-830s?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-29 05:48:09 UTC
From: John Harp
Topic: 10678 Message: 10691

The one rhing you will want to remember in your transverter change is to make sure your IF will line up to your radio you are matching this to.

For example, the TV-502 was made for TS-530 originally in my example and will easily enough alter to 830. James already uses his 502 and 506 on his 530 as I understand from him. In this case going from 144 or 50 mhz to IF of 28 mhz.

The other issue is lines from the radio to supply control like ALC and switching T/R like you would on an amplifier. There may be other factors involved depending on your unit you choose.

As Pete said and he is correct there are some other units out there that are good choices. He pointed out the Down East Microwave products. I was tempted by this idea myself.

But 80 dollars for a unit and a challenge for me of my skills to see if I can make the project work and possibly keep all original was something worth more than the 80 dollars.

To offer something to the group and place it in documentation with permission of our moderators and owner was a contribution I'd like to offer.

Actually transverters are a less talked about subject and it applies the same principals of hetrodyning we already use and are familiar with.

I must admit I've met some new and interesting people to exchange ideas with in the persuit of this project. Originally in another conversation with Ellen she suggested looking into meeting the pack rats. And she was right. I got an officer to post to their reflextors right off the bat.

I also met and am still conversing with one of the spruce pirates of West Viginia another well known group. His call you may be reconize some of you is W3ZZ and name is Gene Zimmerman. Where do you know him from? Open your QST and look at the Articles The World Above 50 MHZ.

Our resources are at our finger tips, in more than just a soldering gun. We have people everywhere. We enjoy communicating with each other. Be it a mic, a vibroplex, straight key, or even a group like we are.

If you want to look into your idea for Drake, ask around your fellow hams. Some may be familiar with that equipment or they may know someone who is. Look for other groups into that line of radios too. Mt Airy VHF is who I contacted, who is near you with a well organized and active group?

Those are my suggestions. Why is there little information about the older equipment? Well manufacturers no longer want to talk about the old stuff they want to sell new. Some people who once had experience at this stuff are falling away from the hobby, be it a change in interests or health reasons or even silent key which I found a lot of.

I found I had to rely on my electronics education and experiences alot to pull me across and others like James who I could call on with my issues and ideas.

We aren't just appliance operators, it just makes the task of getting on the air easier. We can still use our skills to make or alter from something else to achieve our objectives. I just talked quietly on the side to james and Ellen and Gene and others until I saw interest in the group, seeing the reaction.

I'm inspired now to eventually make VHF, discover sporadics and ducting and VUCC and learn about the grids around me. And I will achieve that level in time. For now I will also enjoy a gaining a little experience in the opportunity that presented itself to me and hopefully share with others.

So look into your idea Joe. It may be something worth your effort. Keep it in your budget in case of a problem and if it takes a little longer to achieve than expected don't let it get you discouraged and abandon it. 80 won't hurt me if it is broke beyond repair and I know where another is for spart parts.

Get your documentation out. Look into it. Give it some thought. Ask questions.

Alot of the all mode radios today will already go there. I pondered the project I have for my introduction to VHF for it's price and worthwhile challenge to me. Gene thought it was a good idea.

Rick start with web pages. ebay sells them occasionally. Watch parts swaps. silent keys are estate sales and often there is auctions. There are groups around that will auction radio gear for family of the deceased and the like.

Go to Down East Microwave and look at what they have. They even have stuff that will attach to a Kenwood. Put the word out among others and see what comes back. This is a technique comonly used by small businesses. They talk to each other just as we do.

Hamfests can be a cheap resource. Watch classifieds. They are around. You just gotta watch, do your homework, bid carefully and esablish a budget and stick to it.

I already am used to messes, I work with ink for striping wire all week long. I remember that about maechanical vibration in amps forgot about that. I once used epoxy to seal a coil for a motorcycle once. Good point.I did consider the PCB method and wondered how to get the spacing between pins if mounted as a facing. Maybe using those cicuit transfers and etching would work. I even pondered the thought of securing the pins to a nail file some how like RTV sealant, while sitting in the socket.

Ellen R <ellenjoanne2003@...> wrote: Hi John,

I like the 2nd idea of using poured plastic. It will be mechanically sturdier. But you will need to make sure that the pins stay aligned during molding. Don't see much of them. They are a model used in Europe I think. Similar to 830S. Should be a good radio to use I would think, if it is in good working shape. If it is all there with manual and the price is right and working with known issues not a problem I'd say go for it.

The TS830M has AM modulation also, hence the M instead of S. Otherwise,
same rig as S model.

From: n9wb
Topic: 10645 Message: 10696

Jody:

You will need a small soldering iron, and solder made for electronic work called Rosin Core. Ace Hardware has an inexpensive small pencil iron by Weller that I like better than the Radio Shack ones. Some day you will want a better temperature controlled iron, but this will do for now. Radio Shack solder is good. You will need solder wick and/or a device called a solderpulit. It looks like a large hypodermic needle and vacuums hot solder from a connection.

You will need an inexpensive analog Volt Ohm meter. Something in the $10 to $30 range will be enough. When you get the meter, do NOT connect the meter to a live circuit in any position but AC or DC volts.

You will need some hand tools like screwdrivers, small needle nose pliers, and small wire cutters. You may already have most of this. Radio Shack or Fry's is a local source for small hand tools. Screwdrivers can be found at Wall Mart of Dollar stores. At our Dollar store, there is a set of small jeweler's screw drivers for a dollar. Alignment tools and things like that can be gotten as you need them.

You should also find the article called "Save Your Transformer!" In the files section of this group.

Build this device before you attempt to power up your rig. It is a simple device that places a light bulb in series with the hot side of the AC line to your rig so if there is a short, damage to the transformer does not occur. You should place this in line with your rig before you turn it on since you know that there is a problem.

Do you have a owner's and service manual for this rig ?

Likely what has happened is that the final tubes shorted and blew the line fuse and two resistors. Hopefully the previous owner did not keep trying fuses or a larger fuse and your transformer is OK.

The resistors that may be damaged are two 10 ohm 1 watt resistors on the final board in the cathode circuit. We can tell you how to check them.

So the first step is to remove the final tubes, treat them as though they are good until you find otherwise. Tape or position the caps from the tube plate caps so they will not short to anything.

Place the correct fuse (6 amp for 120 volt operation) in the rig.

Connect it to the light bulb tester. When you turn it on, the light bulb should be bright and quickly dim down. If it stays bright, unplug the rig and we will take you from there.

If all is well, see if the rig receives. Tell us what you get from these steps.

Now READ THIS FIRST!!!

CAUTION: These rigs have high voltages in them as high as 900 V. Work Safely. There is very high voltage inside the final cage. There is also high voltage on the bottom around the power transformer and on the rectifier and High voltage board. The capacitors in these rigs will hold these high voltages after they are turned off. There are bleeder resistors that are SUPPOSED to bleed off these voltages in a couple of minutes. However, what if one or more of these is bad? and this is not at all uncommon. So if the rig has been on in recent days, or if it has just been turned off, wait 2 minutes, then using a screwdriver with an insulated handle, short the top of the plate choke to the final cage ground. This point is the top of the long choke coil where the plate caps connect to. Between this point and the plate caps there will be parasitic chokes that are resistors with wire wrapped around them. Where these connect to the choke is a good place to discharge the high voltage. ALWAYS unplug the rig when working on it! Never trust the off/on switch. The off/on switch does not always disconnect all of the voltage from the wall and it does not always work so don't bet your life on it.

We will wait to hear from you.

Vy 73, Walt N9WB

Subject: [TS-520_820_530_830] (Newbie Advice Needed) Tools I should get for fixing up non-working 520-s?

I have a non-working 520-s that I was originally going to send to Ken Kemski to have refurbished, but I'm having second thoughts. It's not anything to do with Mr. Kemski, as it's a no-brainer that he could do a much better job (and quicker) fixing and refurbishing my radio than I can. However, I actually want to LEARN about how to work on this old radio. Right now I have ZERO tech skills, but I'm willing to learn. And what better way to learn than on an old radio that already doesn't work. The worst thing I can do is--fix it.

A little background: I got the radio off of an Ebay auction where the seller was up front about the radio not working. The seller said that they turned it on, heard a popping sound, saw a wisp of smoke come from the radio, and then it went dead, never to turn on again.

I would be interested to know if this sounds familiar to anyone here and what it likely means. I would also like to know what tools I will need for working on this radio and where I can likely get them. I do have a local Radio Shack where I live if that helps.

By the way, the FCC issued my callsign yesterday, 10/26/06. I am officially a Technician class license holder, and my callsign is KE7JII. I will upgrade in a few months, but right now I'm just getting my feet wet with the local vhf community and looking forward to tearing apart my old Kenwood.

Thanks in advance for your help!

Jody A(lan) Mills, KE7JII

10697. Here is an unusual question.....

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-29 12:17:30 UTC
From: Doug Behl
Topic: 10697 Message: 10697

Hello,

I'm new to the group, joining specifically to get one question answered. Searched through the messages, and didn't see a previous question of this nature, so here it goes.

I recently sold a Kenwood AT-250 to an elderly gentleman. After he received it, he said that he couldn't hook it up to his Kenwood TS-120 and TS-820 rigs. The AT-250 is made for the 430/440 series of radios.

First off, I don't own either of these rigs, so not too familiar with them. But, I didn't think you needed an antenna tuner for an 820. Doesn't the rig tune up procedure eliminate the need for an antenna tuner? If it does need a tuner, how would one go about connecting the AT-250 to the rig?

To me, it makes more sense to use the AT-250 with the TS-120, but still would like to know how. I couldn't find a manual on the internet for a TS-120.

If I could build him the right cable(s), that would be great. I would like to make this work for him on his rigs, or offer him his money back. Any help would be appreciated.

Best regards,

Doug Behl VE3XDB

Well if AM is what your after then it would probably be a good deal if the radio has no iisues or something you could live with for the price, whatever the price is. Other than that it's an 830 which is known for being a good radio. It is aged now do remember that.

Doug, as recall the AT-250 you refer to is not of our tube final gear. The tuner matched to the TS-830 the latest of our tube hybrid models The AT-200 was the match up at that time.

The AT-250 was matched to the TS-140S. We don't have that in our archives. Although there maybe someone around who has or had the experience of this in our group. Rig pix and Universal Radio discontinued accessories is where I looked for this info I commented on.

I looked in the BAMA manuals and no luck there. You could look post the question to eham.net. Search there before you do.

You could contact Kenwood, but it probably won't get you much but thier mailings of thier latest gear they sell as flyers and a band chart.

A look thru the buxcomm catalog may produce an idea.

Has this person need for a tuner for 820? that might line up to an AT-200.

My question for him is did he give thought to an SGC Tuner? For the price it it isn't far from what was spent for the unit. LDG may be an option also.

I have an SGC-239 tuner I bought and put in a plastic box for a force-12 flagpole I have here. It's reliable for me. and water is not a problem with it.

Searcching manuals may be the best bet, but will take time.Out on ebay there' a store that sells manuals on CD. They have a store. The person for name is James G McQuagge Jr and email is k4lix@... name of the outfit is B & M Distributors P.O. Box 6227 Panama City, FL 32404-0227 the web page is www.hammanuals.com

That's my thoughts and suggestions for a search of the answers. To match the auto tuner to the radio may take some time and effort.

You do need a tuner for the TS-820 if your antenna is
not resonate for the frequency, that is, over 3:1 or
so. I don't use one on my TS-820S as I have a
tri-bander and an inverted V for 40 & 75, which are
all resonate in those bands.

Of course when you get to extreme ends each side of
the resonant frequency having an AT-200 would be just
the tuner to tweak the SWR to 1:1 or so.

Not familiar with the tuner you sold so can't comment
on that.

Good luck,

From: John Harp
Topic: 10697 Message: 10702

Well Bill you must remember that you have tube finals and they are a little more forgiving than solid state finals. SOme radios with solid state finals won't let you operate past 1.8 to 1. That little protection circuit does just that, protects your transistors during higher SWR.

On theother hand tube finals are a little more forgiving. 3 to 1 is not so bad for tubes. You go high enough and you could soften them up a little inside. 5 to 1 yeah I'd be concerned.

Your real question is what your losing out the transmission line to the antenna. Consider that loss. Not a big deal if your on open wire line. But how many people are? Are you running coax? Then it's time to consider looking into it. It might pay to use a tuner for you.

Here's an example. I run 1.3 to 1 from band edge to band edge on tube finals. I run a vertical. That's considered flat or close enough to call it that.That's not a sub band that's the whole band. Now I have a versa five tuner and a big linear for full bore power that heats the station when I key. :) Ha Ha!!

I can bypass the tuner and run straight in and more power goes out there. If SWR is to high I have a choice, cut power to save life in my radio and it's tubes or turn on my tuner. At 3 to 1 yeah I'll turn on my tuner.

I ran a cheapie little tuner on my 830 for years with coax to dipoles and the like. especially when it became non resonant or less resonant to where I wanted to transmit at the time. That was about 100 watts. Tubes lasted longer for me then. how many tube and neutralization changes do you go thru to pay for a tuner. to me it was a no brainer. Some where down the road it would pay for itself.

Today I've spent some money into a good antenna and a good feed line. A good ground and here oveer 25 years later on my second 830 and still have my first. i'm not into anything but two touch lamps in our house and the neighbors don't even know if I crank the power up. Why? because I am resonant to the antenna the cables buried underground too.

Some people use a balun out the end of a line. It helps prevent unwanted radiation. That means some of your power went to waste in an unwanted way and may be getting into something else asdn causing problems for you.

A TS 820 has the same finals as the 830 for all intended purposes. Take care of them and they'll last.

By the way I have 60 radials and I feed with hardline. The ground resistance is low. The vertical is built of wide tubular aluminum. Most all power gets off the antenna I generate. Power where I want it.

The ground run for the station is short and low inductance. Something less than 6 foot. That's good for HF, to long rod in farm land soil.

For a back up I have a flagpole with an auto tuner. visitors come they can park and operate just like me with thier gear.

Plan your station carefully. It's worth the effort. I've had G5RV's and other dipoles with good success too. I've had general purpose wires and end feds too.

Your 820 will do just as good. I have the 830 because my sight is getting worse now. The displays help me. I'll take an 820 or a 530 as substitution.

Cut your antennas to where you want them to operate. Tuners will help beyond that. Remember it doesn't correct the condition, it only lets your radio see the line a little better. We put our tuners on the station end, we'd do better to put them on the antenna end. Then the line wil be flat and radiate less thus less loss that way. any one for building a tuner for the other end? there's a few around you can use. For example: the SGC-239 is one for a cheap price for 100 watts out. It just needs a water tight shell.

Yes I went a little long on your answer, but hopefully gave you something to think about too. 3 to 1 on your 6146's well it's taking a little life a little sooner. But it will go a while. Then again what do you have to lose?

I looked in the BAMA manuals and no luck there. You could look post the question to eham.net. Search there before you do.

I have e-mail Doug copies of both manuals. The AT250 tuner will work with the 820 although not in automatic mode. The auto mode is bypassed, and while transmitting a small carrier signal, pressing the TUNE button on the AT250 will engage the tuner.

The matching tuner for the TS830 is the AT-230. The AT-200 did not have WARC band coverage.

Good deal and thank you. I thought of the 230 after the writing. Thanks.

ve3tmt <ve3tmt@...> wrote: --- In TS-520_820_530_830@yahoogroups.com, John Harp <ka3dpw@...> wrote:

I looked in the BAMA manuals and no luck there. You could look post the question to eham.net. Search there before you do.

I have e-mail Doug copies of both manuals. The AT250 tuner will work with the 820 although not in automatic mode. The auto mode is bypassed, and while transmitting a small carrier signal, pressing the TUNE button on the AT250 will engage the tuner.

The matching tuner for the TS830 is the AT-230. The AT-200 did not have WARC band coverage.

It seems to happen when they get a heavy traffic load craig. Although I've only seen it here on this group, but the other ones I belong to don't move as much volume. So they probably aren't moving something when it occurs I guess. Like verticals2, they have a busy month if they got more than 3 postings. But this moves more than 3 just in one day. Another Amps group I belong to may not move for 2 months.

It is possible that your mail box is getting full and your messages are "Bouncing". After so many bounces, Yahoo turns your individual e-mails off.

I couldn't believe there were only 8 messages tonight. That hasn't happened since I started this group thing. Craig i'm wondering how many people got bounced this time.

30's is a low number for me. 60's, or 70's is normal and the highest I remember seeing is 170 some thing. Three hours is not unusual to spend working this. What'll I do tonight. Go to bed early? :)

10720. Re: AT-250 Tuner

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-31 14:04:31 UTC
From: Bob M
Topic: 10697 Message: 10720

I had one running on a TS-530s no problems It was Din cabled into back of rig. Yes you need to turn off AUTO and be sure that you Turn the power down to 20watts when tuning.

When I got mine a previous owner had made up a push momentary switch and cabled it to a rear din plug to key the rig for tuning.

Boy do I prefer my Ranger SRA-2300 auto Tuner dosn't matter which band if I move a few Khz or Mhz or even Hz when I rekey the mic it takes about 20ms to retune to where I now am on the band.

Regards Bob M

Hi Ruben,
I haven't been posting much due to a death in the Family.
Overall posting seems to be down, but It will pick back up.
73,
Gordon

10729. Contact for W3PLC?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-10-31 22:45:28 UTC
From: dsimmons1999
Topic: 10729 Message: 10729

Does anyone have contact info or news about Tim, W3PLC who previously did radio repairs as TD Communication?

His web site is gone, emails to several addresses go unanswered, the phone doesn't pick up, and directory information has no listing.

If you don't feel comfortable giving out any info but can contact him, please ask him to email or phone me (he has my contact information). Hopefully he is OK, but I'd like to discuss the status of my TS-830.

Thanks,

- Dave

Dave,
I just tried calling tim, But as you found.. No Answer. I dropped him
an Email and asked if all is well.
He calls me from time to time, so we'll see.

I found a website of Dave W3PLC.http://www.zelie.com/~geno/w3plc.htm You may want to check it out.

I haven't seen him for a couple years now. I made a trip to see him once. These pictures are not far off of what his shop is like.

He did my 830.

I've tried to contact him my email a few times. Never heard back. Calledand left a message and no answer when I left a message.

He has been very busy since lightning hit the county communications that one time.

His main stay is the county. It's big bucks and alot of hours.

After that lightning hit he was very busy with the rebuilding. He mentioned taking a little time off, but couldn't at that time.

An email shoed up one time about lightning hitting his place. It gets bad up where he's at. But his shop has a really good ground system from what I remember. The emails said something about a hit by lightning but if the pictures are recent, I'd doubt it. That looks like the same test bench and equipment as when I was there.

No he's eitherr busy or having a little time off. Tim isn't one to just up and leave someone hanging. There would definitely a reason. I may very well be family. I'm not at liberty to discuss his matters. Remember it's been two years since I've visited him. He's a busy man. If he's backed up it could take a little time.

Don't feel bad Chris, thge last one I sent you bounced back. How's the Kenwood coming? That's what I wanted to find out.

I've been busy with transverter stuff.

Last night I only had 8 messages on here and one on another web mail from Gene Simmons W3ZZ. Needless to say, I went to bed early. I was wondering who Yahoo bounced this time?

But your right it has been quiet.

Yes, that's why I built an antenna a little broader. I have an SGC-239, but I like my Versa tuner 5 more. Sometimes I just bypass it and others I tune and its set for quite a band width.

Bob M <baysideq@...> wrote: I had one running on a TS-530s no problems It was Din cabled into
back of rig. Yes you need to turn off AUTO and be sure that you Turn
the power down to 20watts when tuning.

When I got mine a previous owner had made up a push momentary switch
and cabled it to a rear din plug to key the rig for tuning.

Boy do I prefer my Ranger SRA-2300 auto Tuner dosn't matter which
band if I move a few Khz or Mhz or even Hz when I rekey the mic it
takes about 20ms to retune to where I now am on the band.

Regards Bob M

10742. AT-200 basic question

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-01 00:41:06 UTC
From: drewr3227
Topic: 10742 Message: 10742

Hi group,

I joined the group about a month or so back and have been reading all the posts and learning a great deal. I have never worked inside a radio...having said that, I have a TS-520S with the AT-200 antenna tuner and a VFO-520. Here is my very basic question: does the AT-200 have a meter lamp in it? I removed the case and bezel and did not see a lamp or a holder; did I not go far enough in disecting the tuner?

Thanks for your help,
Drew Robinson

Jim:
Sorry to take so long to get back on this. A very good friend of mine who is a ham just purchased a very expensive Bluebird motor home. He planned to go to the Bluebird convention this weekend. He brought it home and plugged the 50 amp 240 V plug in to the pedestal without turning the breaker off first. He apparently contacted both legs before contacting the neutral. If you know how these are wired you will understand why I have been on a Marathon effort replacing contactors and parts in the inverters to get him on his way. He sailed Sunday for Georgia. I am now catching up on all of my other angry customers whose projects I dropped to get him off to the convention.

The off topic moral, ALWAYS turn the breaker off at the pedestal before connecting the shore line or you will hate it!.

Now back to amplifier linearity.

The output section of most SSB rigs is a linear amplifier. When the load control in a PI network is adjusted for too much capacitance, the output reduces, the gain reduces, but so does the top of the linear region. Unless you drop the drive way down, you are driving the grid to saturation. Intermodulation distortion occurs when more than one frequency signal are present and a non-linearity causes additional frequencies that are sums and differences of these original frequencies.

With RF amplifiers, a common way to adjust them is to use a Two Tone Test. With this test the signal is modulated with two audio tones simultaneously typically around 400 Hz and 1500 Hz. The RF input signal of a amplifier is sampled and applied to the horizontal input of a scope in place of the internal sweep and the output signal is sampled and applied to the vertical input of a scope. A trapezoid pattern is developed that looks much like a diamond. If the corners of the diamond are square and the sides are straight, the amplifier is nice and linear. But if the sides are bowed and the corners are rounded, intermodulation distortion is being generated.

The Kenwood monitor scope and the Yaesu monitor scope are designed for this purpose. When adjusting an amplifier, if I tune it for maximum output with a CW carrier and then check it with a two tone test, I usually see IMD. If I advance the load control slightly clockwise and then repeak the plate control, the pattern becomes clean. But if I change the loading CCW (closing the load capacitor) and repeak the plate or leave the plate as is, the pattern looks horrible.

In our Kenwoods, the 12BY7 drives the S2001/6146 finals. This final stage is a class AB1 linear amplifier. If we were to sample the input and output of the S2001/6146 amplifier stage in the same way, the same thing will occur. Extreme IMD gives your audio a muffled fuzzy sound and these intermodulation

components of the many tone signal, your voice, splatter a considerable distance away from your operating frequency causing harmful interference to other QSOs.

So reducing the output by closing the load capacitor CCW from the peak will increase the IMD.

While some of us tune our amplifiers with a scope and a two tone generator, I don't know of any of us that tune the rig's finals this way. But if the load control is going to be off peak NEVER have it closed more than the peak point. If you want to be a perfectionist, after tuning the rig to max, open the load capacitor clockwise to reduce the CW output by 10% and repeak the tune control. The Plate/cathode current will actually be a bit higher and the efficiency will appear to be a tiny bit lower this way. This is not actually necessary, but never have the load CCW of peak. If there is error, have it in the clockwise direction.

The 10 % trick can be used when loading amplifiers if you do not have a Two Tone test setup.

The ESSB guys often actually occupy less ultimate bandwidth than many hams that do not use wide filters because the ESSB guys are very concerned about IMD. IMD really messes up fidelity. No matter how narrow your filter, If you have IMD in excess of -30 dB down, you are going to be a band hog.

The above information is not true for CW, FM, or high level modulated AM. It is true for low level modulated AM, however.

We sometimes hear on our bands extreme cases where an Amateur sounds good but turns on an amplifier and he is muffled, fuzzy, and splatters. This is often due to IMD because the amplifier is poorly tuned or overdriven. It can also be due to increased RF interference to the audio system that causes IMD in the audio system.

Walt
Thanks very much. This is the most precise, concise description I have ever seen of the tune up procedure. Might I suggest it be added to the files.
regards
Barry

10750. Help with TS-530S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-11-02 05:05:26 UTC
From: Stephen Davis
Topic: 10750 Message: 10750

Hello All,

I just replaced the plastic coupler on the band switch shaft of my TS-530S with a metal one from Ken. The replacement went great and now the band switch is good and tight, with no play. However during the replacement, I was not as observant as I should have been...Rats!! After I had loosened the plastic coupler and slid the shaft forward in order to get the old coupler out, I noticed a bare stiff wire (like an unfolded paper clip) laying on the rf board. This was very puzzling to me, but I picked up and put it aside and finished replacing the coupler. I then tried to figure out were the wire had come from. As I scanned the innards of the radio around the shafts, I finally noticed a similar wire that was between the RIT/IF shaft and the MIC/CAR shaft. It seems to be held in place by tension. I must have inadvertently dislodged the one I found lying on the rf board, but I don't know where it belongs.

I was wondering if anyone knows the purpose of this wire. Also I was hoping that someone with a TS-530S would be kind enough to open up their radio and try to find the second wire and let me know where it is located (I think it should be somewhere around where the band shaft goes into the finals cage). Although the radio works great after changing the coupler, it still bothers me that I missed something like this. I would like to put the wire back where it belongs!

Thanks

Steve K7QHU

PS It was hard to describe the above clearly. I can take a picture of the wire that came loose and a picture of the other wire in place and post the pictures if that would help.

" I was wondering if anyone knows the purpose of this wire." <snip>

The two wires (~1-1/2" long) are bandswitch shaft tensioner springs. One behind the front panel, & one on the front of the PA cage. There are two stamped tabs on the panel/cage on the left & right sides of the shaft penetration in which to place the ends of the springs. You can reinstall them fairly easily with a small flat screwdriver, but a small pair of needlenose pliers or hemostats makes it less likely that the spring will fly away in the process.

Actually the 10% rule is my term. and the 10% figure is relative. 5% may work just as well. Don't want to mislead anybody. But the main thing is do NOT have the load to the left (CCW) of the max point. Always keep the tune at max.

n9wb <n9wb@...> wrote: Jim:
Sorry to take so long to get back on this. A very good friend of mine who is a ham just purchased a very expensive Bluebird motor home. He planned to go to the Bluebird convention this weekend. He brought it home and plugged the 50 amp 240 V plug in to the pedestal without turning the breaker off first. He apparently contacted both legs before contacting the neutral. If you know how these are wired you will understand why I have been on a Marathon effort replacing contactors and parts in the inverters to get him on his way. He sailed Sunday for Georgia. I am now catching up on all of my other angry customers whose projects I dropped to get him off to the convention.

The off topic moral, ALWAYS turn the breaker off at the pedestal before connecting the shore line or you will hate it!.

Now back to amplifier linearity.

The output section of most SSB rigs is a linear amplifier. When the load control in a PI network is adjusted for too much capacitance, the output reduces, the gain reduces, but so does the top of the linear region. Unless you drop the drive way down, you are driving the grid to saturation. Intermodulation distortion occurs when more than one frequency signal are present and a non-linearity causes additional frequencies that are sums and differences of these original frequencies.

With RF amplifiers, a common way to adjust them is to use a Two Tone Test. With this test the signal is modulated with two audio tones simultaneously typically around 400 Hz and 1500 Hz. The RF input signal of a amplifier is sampled and applied to the horizontal input of a scope in place of the internal sweep and the output signal is sampled and applied to the vertical input of a scope. A trapezoid pattern is developed that looks much like a diamond. If the corners of the diamond are square and the sides are straight, the amplifier is nice and linear. But if the sides are bowed and

the corners are rounded, intermodulation distortion is being generated.

The Kenwood monitor scope and the Yaesu monitor scope are designed for this purpose. When adjusting an amplifier, if I tune it for maximum output with a CW carrier and then check it with a two tone test, I usually see IMD. If I advance the load control slightly clockwise and then repeak the plate control, the pattern becomes clean. But if I change the loading CCW (closing the load capacitor) and repeak the plate or leave the plate as is, the pattern looks horrible.

In our Kenwoods, the 12BY7 drives the S2001/6146 finals. This final stage is a class AB1 linear amplifier. If we were to sample the input and output of the S2001/6146 amplifier stage in the same way, the same thing will occur. Extreme IMD gives your audio a muffled fuzzy sound and these intermodulation components of the many tone signal, your voice, splatter a considerable distance away from your operating frequency causing harmful interference to other QSOs.

So reducing the output by closing the load capacitor CCW from the peak will increase the IMD.

While some of us tune our amplifiers with a scope and a two tone generator, I don't know of any of us that tune the rig's finals this way. But if the load control is going to be off peak NEVER have it closed more than the peak point. If you want to be a perfectionist, after tuning the rig to max, open the load capacitor clockwise to reduce the CW output by 10% and repeak the tune control. The Plate/cathode current will actually be a bit higher and the efficiency will appear to be a tiny bit lower this way. This is not actually necessary, but never have the load CCW of peak. If there is error, have it in the clockwise direction.

The 10 % trick can be used when loading amplifiers if you do not have a Two Tone test setup.

The ESSB guys often actually occupy less ultimate bandwidth than many hams that do not use wide filters because the ESSB guys are very concerned about IMD. IMD really messes up fidelity. No matter how narrow your filter, If you have IMD in excess of -30 dB down, you are going to be a band hog.

The above information is not true for CW, FM, or high level modulated AM. It is true for low level modulated AM, however.

We sometimes hear on our bands extreme cases where an Amateur sounds good but turns on an amplifier and he is muffled, fuzzy, and splatters. This is often due to IMD because the amplifier is poorly tuned or overdriven. It can also be due to increased RF interference to the audio system that causes IMD in the audio system.

This is a spring. I don't have a 530 here, but it probably goes where the shaft enters the final cage similar to the other one that you found.

Subject: [TS-520_820_530_830] Help with TS-530S

Hello All,

I just replaced the plastic coupler on the band switch shaft of my TS-530S with a metal one from Ken. The replacement went great and now the band switch is good and tight, with no play. However during the replacement, I was not as observant as I should have been...Rats!! After I had loosened the plastic coupler and slid the shaft forward in order to get the old coupler out, I noticed a bare stiff wire (like an unfolded paper clip) laying on the rf board. This was very puzzling to me, but I picked up and put it aside and finished replacing the coupler. I then tried to figure out were the wire had come from. As I scanned the innards of the radio around the shafts, I finally noticed a similar wire that was between the RIT/IF shaft and the MIC/CAR shaft. It seems to be held in place by tension. I must have inadvertently dislodged the one I found lying on the rf board, but I don't know where it belongs.

I was wondering if anyone knows the purpose of this wire. Also I was hoping that someone with a TS-530S would be kind enough to open up their radio and try to find the second wire and let me know where it is located (I think it should be somewhere around where the band shaft goes into the finals cage). Although the radio works great after changing the coupler, it still bothers me that I missed something like this. I would like to put the wire back where it belongs!

Thanks

Steve K7QHU

PS It was hard to describe the above clearly. I can take a picture of the wire that came loose and a picture of the other wire in place and post the pictures if that would help.

Hey it's a start Stephen. Here's what I suggest. Tape it or somehow secure it to the inside of the radio so it won't get lost. It's use will show up soon enough. Some one here may know that has a 530. I have 830's so it's not something I could figure out for you. Those might be a hard to replace item, so don't lose it. Alot of things are similar on different models but just in case.

Thank You Walt. I never heard of the 10% rule. I try to remember that. And turn it slightly clockwise and retune it. Thanks.

n9wb <n9wb@...> wrote: Jim:
Sorry to take so long to get back on this. A very good friend of mine who is a ham just purchased a very expensive Bluebird motor home. He planned to go to the Bluebird convention this weekend. He brought it home and plugged the 50 amp 240 V plug in to the pedestal without turning the breaker off first. He apparently contacted both legs before contacting the neutral. If you know how these are wired you will understand why I have been on a Marathon effort replacing contactors and parts in the inverters to get him on his way. He sailed Sunday for Georgia. I am now catching up on all of my other angry customers whose projects I dropped to get him off to the convention.

The off topic moral, ALWAYS turn the breaker off at the pedestal before connecting the shore line or you will hate it!.

Now back to amplifier linearity.

The output section of most SSB rigs is a linear amplifier. When the load control in a PI network is adjusted for too much capacitance, the output reduces, the gain reduces, but so does the top of the linear region. Unless you drop the drive way down, you are driving the grid to saturation. Intermodulation distortion occurs when more than one frequency signal are present and a non-linearity causes additional frequencies that are sums and differences of these original frequencies.

With RF amplifiers, a common way to adjust them is to use a Two Tone Test. With this test the signal is modulated with two audio tones simultaneously typically around 400 Hz and 1500 Hz. The RF input signal of a amplifier is sampled and applied to the horizontal input of a scope in place of the

internal sweep and the output signal is sampled and applied to the vertical input of a scope. A trapezoid pattern is developed that looks much like a diamond. If the corners of the diamond are square and the sides are straight, the amplifier is nice and linear. But if the sides are bowed and the corners are rounded, intermodulation distortion is being generated.

The Kenwood monitor scope and the Yaesu monitor scope are designed for this purpose. When adjusting an amplifier, if I tune it for maximum output with a CW carrier and then check it with a two tone test, I usually see IMD. If I advance the load control slightly clockwise and then repeak the plate control, the pattern becomes clean. But if I change the loading CCW (closing the load capacitor) and repeak the plate or leave the plate as is, the pattern looks horrible.

In our Kenwoods, the 12BY7 drives the S2001/6146 finals. This final stage is a class AB1 linear amplifier. If we were to sample the input and output of the S2001/6146 amplifier stage in the same way, the same thing will occur. Extreme IMD gives your audio a muffled fuzzy sound and these intermodulation components of the many tone signal, your voice, splatter a considerable distance away from your operating frequency causing harmful interference to other QSOs.

So reducing the output by closing the load capacitor CCW from the peak will increase the IMD.

While some of us tune our amplifiers with a scope and a two tone generator, I don't know of any of us that tune the rig's finals this way. But if the load control is going to be off peak NEVER have it closed more than the peak point. If you want to be a perfectionist, after tuning the rig to max, open the load capacitor clockwise to reduce the CW output by 10% and repeak the tune control. The Plate/cathode current will actually be a bit higher and the efficiency will appear to be a tiny bit lower this way. This is not actually necessary, but never have the load CCW of peak. If there is error, have it in the clockwise direction.

The 10 % trick can be used when loading amplifiers if you do not have a Two Tone test setup.

The ESSB guys often actually occupy less ultimate bandwidth than many hams that do not use wide filters because the ESSB guys are very concerned about IMD. IMD really messes up fidelity. No matter how narrow your filter, If you have IMD in excess of -30 dB down, you are going to be a band hog.

The above information is not true for CW, FM, or high level modulated AM. It is true for low level modulated AM, however.

We sometimes hear on our bands extreme cases where an Amateur sounds good but turns on an amplifier and he is muffled, fuzzy, and splatters. This is often due to IMD because the amplifier is poorly tuned or overdriven. It can also be due to increased RF interference to the audio system that causes IMD in the audio system.

Does anyone have a source or suggestions on converting the low imoedance output of my audio rack to a high impedance for better coupling to my 830? I realy don't want to part with the rack but feel it suffers somewhat because it is presenting a low impedance to the radio. When I used to use my old MC50 mic, the average level was always higher in the high impendance setting as was the same with my W2IHY box.

Hi Max,

I'm not sure I know the answer but I'll foolishly venture in. That way others who know more will have a good target to shoot at :-)

I'm thinking it doesn't matter. Your "low impedance" audio rack has active circuitry on the output that can generate a voltage into just about any impedance from low to infinite. I doubt that the input impedance of the mic circuit in the 830s is presenting any problems.

I use a behringer mixer to feed my mic input. I get so much out of the behringer that I have to turn it waaaay down to make it work right. When I've fed the signal from the mixer into my compressor and parametric EQ, I recall the level coming out of those units was not as high but was still high enough. In each case, I compensated by just increasing or decreasing the output level of the unit(s) until I got proper ALC indication with the 830s mic gain at about mid scale.

I read the manual - online as a PDF - shows the schematic etc. I think it would be easy to build the kit. so I sent an email to Santa [my wife] hinting about the kit.

I recently got a new Behringer mixer board [complete with some fancy EQ capability] at a fire sale price. I have a nice RS by Shure Hi-Ball mic and an EV 664. I also have a RS 10 band per side EQ and an Alesis Nanocompressor. If Santa gets me one, I'll be horsing around with this.

One thing nice about the ibox is that it allows for handy PTT capability.

If Santa does not get me one, I'll likely get one sometime in the new year :)

I like the idea of experimenting with HiFi SSB - you won't find me spending 1000s of dollars like some do. But, using existing gear, it worth spending a little bit of $.

Hi Keith,

My voice will still hit 100W peaks or so but the average power is way
down. I know it is due to the impedance mismatch because I
experimented with my MC50 mic. The average RF output was much higher
when I had the mic set on high impedance.

I looked at the schematic Phil, and I don't think it will do as an impedance transformer. The transformer has a 1:1 ratio. Still 600 ohm on the secondary. It looks more like an isolator with level control.

The Behringer mixer/EQ units do an okay job but I think they only have low, med and high EQ adjustments. I used to use a 602. You will get much finer sound from a dedicated EQ unit like the PEQ-2200. The RS 10 band per side unit sounds like a stereo EQ and is really not suited for SSB work. The adjustment ranges on it are much higher than you will ever encounter in voice work. The highest you need for the SSB is around 4K. The stereo units typically go as high as 20K.

> I like the idea of experimenting with HiFi SSB - you won't find me
> spending 1000s of dollars like some do. But, using existing gear,
> it worth spending a little bit of $.

I've fiddled with everything from FT920's, TS850's, TS570's and now the 830 and you can with the right mods make any radio sound good. I don't expect it to sound like an FT9000 but for the small investment I make I think the result is well worth it.

In looking at the specs on my 2200 EQ, it has a high impedance input and only a 60 ohm output. I am feeding the input with a low impedance output from my VX200 into the high impedance input on the EQ and the low impedance output into the high impedance input on the 830. It couldn't get any worse!! I would be better off to sell it all and use a high impedance mic straight into the radio.

Max

Well, I suppose it could be impedance but I'm just can't see how. The active output stages of the rack gear will drive 600 ohm loads as easily as 100 K ohm loads. The mic however, will definitely drive different loads differently since it can't change it's power.

I've seen this when hooking an electric guitar up to a mixing board. Plug the guitar into the board and the sound becomes dull, and thin at the same time as the low impedance input on the board loads down the electro-mechanical pickups. Plug my bass (which has an on-board preamp) into the same board and the op-amp in the bass drive full voltage into the board giving me full rich sound, just like I get when plugging the bass into my bass amp who's input impedance is 1 megaohm.

You say you get different average RF output with the mic. Hmm, could there be a natural compression happening in the mic? If the mic were non linear and compressed things then you'd indeed see what you've described. Have you hooked the MC50 up through the rack gear to see if the same mic through a different signal path gives the same results?

Just an FYI, I picked up an inline impedance transformer (Hosa) at a local music shop. It has a female XLR connector on the low side that plugs right into the EQ output. The hi side (10K ohm) is a 1/4" plug. I made a patch cord and plugged it into the 830's modulator feed. I noticed an immediate difference in the freq response and the feedback from the monitor was gone. Just to confirm I bypassed the transformer and the audio became very dull and the feedback returned.

Cost about $20 CDN.

Oh, *great*, now you're actually producing EVIDENCE that I'm wrong!

LOL!

Glad to hear it Max. Where are you feeding the audio into your rig? Are you bypassing the mic connector on the front and going straight to the balanced modulator or something like that? I wonder what effect the impedance of your sound source has on the balanced modulator. Maybe the issue is that having a low Z thing connected to the balanced modulator was messing it up??? I should be careful here. The more I guess, the wronger I become :-)

I think I have one of those transformers. XLR on one end, 1/4" on the other, cylindrical shape. We tried some in the early days of "the band" as direct boxes but they didn't sound nearly as good as a real direct box so they got set aside very quickly.

73!

Keith,

I feed the audio directly through a 4.7uf cap to the balanced
modulator diodes, which have been replaced with new ones. Not sure
what was causing what but in my hurried "lunch hour" testing session
it did sound better. Of course I will do more serious testing tonight.
The piece you describe is right on the money. Female XLR on one end
and 1/4" plug on the other.

That's probably because the mic was originally made to be used between both kinds of radio inputs. For the Kenwood 830 for example it used the high impedance, like many other older radios of the tube vintage.

As you'll remember the comperssor would be set at about 20 dB's on the meter deflection. That was considered a good setting without overdrive. That's because of the high impedance microphone.

You could try to match that impedance of the rack to the high impedance of the radio. Look in the manual for the radio and the manual for the microphone. They should tell you an impedance value. Try to match that value. Maybe say it's say 600 ohms. Then 600 is your aim. Then look for a transformer of that value.

Do remember that how ever good the rack is the output may be limited by the circuits.

I asked the same question one time as you are now max. Back when my hearing was a little better.

ve3tmt <ve3tmt@...> wrote:

Max:

What is the last item that is feeding your 830? Are you feeding the balanced modulator to the mike input ?

Impedance matching is not always necessary. If there is plenty of level available, a higher impedance driven by a lower source impedance is not a problem.

With the MC-50 mike, the higher impedance worked better because the voltage was higher. Tell us more about what you are doing.

A transformer that goes from 600 ohms to 10 K will transform the impedance. But it may not be necessary.

OK Max, probably the transformer is acting as an RF choke as well as stepping up the voltage. If it is a good quality transformer and it seems that it is, it probably is your best bet because of it's ability to suppress RF. Glad you got it worked out, hope to hear you on soon.

I assume that you have a 4 wire cord on it ?

See page 7 of your Kwnwood TS-820 owner's manual.

Pin 1 on your mike plug connects to the white wire from your D-104.
Pin 2 connects to the red wire.
Pin 3 connects to the Black wire
Pin 4 connects to the shield wire.

Place some shrink tubing or use tape so the shield does not contact the microphone plug shell.

If this does not work, or if your cord is different, contact us. We will figure it out.

I purchased some 4 pin plugs at Dayton this year that were numbered backwards. The picture on page 7 is the view of the plug from the wire connections as though it was plugged into the radio.
